3.5.1.2	Select Response	26
3.5.1.3	Deselect Request	26
3.5.1.4	Deselect Response	26
3.5.1.5	Linktest Request	27
3.5.1.6	Linktest Response	27
3.5.1.7	Reject Request	27
3.5.1.8	Separate Request	27
3.5.1.9	Data Message	27
3.5.2	Connections	27
3.5.2.1	Delegates	28
3.5.2.2	Active connection	28
3.5.2.3	Passive connection	29
3.5.2.4	Multi-passive connection	29
3.5.2.5	Connection manager	29
3.5.3	Handler	30
3.5.3.1	Events	30
3.6	Class reference	31
3.6.1	HSMS	31
3.6.1.1	Packets	31
3.6.1.2	Connections	35
3.6.1.3	Handler	38
3.6.1.4	ConnectionManager	39
3.6.2	SECS	40
3.6.2.1	Variables	40
3.6.2.2	Data Items	68
3.6.2.3	FunctionBase	122
3.6.2.4	Functions	122
3.6.2.5	Handler	188
3.6.3	GEM	193
3.6.3.1	Handler	193
3.6.3.2	HostHandler	199
3.6.3.3	EquipmentHandler	206
3.6.4	Common functionality	213

secsgem is a python package to communicate with a host or equipment system in the semiconductor industry.

The use cases range from writing tests for implementations or features, simulations in development environments to complete host/equipment implementations. Some parts of the package can be used individually, for example HSMS can be used without SECS-II, or the streams and functions can be used with a different networking stack.

Currently there is no support for communication over serial port (SECS-I, SEMI E04). Only ethernet (HSMS, SEMI E37) is available.

HSMS, SECS and GEM are standards from [SEMI](#).

CHAPTER 1

Namespaces

All classes can be accessed with their full module name or directly from the secsgem module.

```
>>> secsgem.format_hex("Hello")
'48:61:6c:6c:6f'
```

```
>>> secsgem.common.format_hex("Hello")
'48:65:6c:6c:6f'
```

CHAPTER 2

Thanks

- Carl Wolff for his sample TCP socket implementation
- Darius Sullivan for his [gist](#) on how to use the streams and functions with twisted
- Massimo Vanetti for his help on the equipment implementation

CHAPTER 3

Table of contents

3.1 Installation

Official releases are available via [Pypi](#) repository. The easiest way to install these is using a package manager like pip:

```
$ pip install secsgem
```

In order to use the current development code, which might be instable at times, use the git repository directly:

```
$ pip install git+git://github.com/bparzella/secsgem
```

3.2 First Steps

secsgem can be used in different ways. You can use it to create a GEM implementation for either equipment and host side. But also implementations on the SECS-II and HSMS levels are possible. Another way to use it is for testing your host or equipment implementation using python unit tests.

3.2.1 Callbacks and events

Callbacks are used to handle requests from the remote system and return a user defined result (eg an alarm has been received and a response is required). *Events* can notify the implementation about something that occurred (eg the hsms connection was selected). Events don't return any result to the remote and are executed in the background

3.2.1.1 Callbacks

Callbacks are used to request information from a specific implementation. They can be used to process the passed information and present a result to the peer. Only one function can be registered for one callback.

The process will wait for the callback to return the result of the calculation. Because of that the callback should run as performant as possible.

There are three ways to define the callback functions, by creating them in the *inherited handler*, by setting a *target object* and by *registering callbacks*. Registered callbacks superseed target and overridden functions.

Inherited handler

When working with a inherited class, callbacks can be implemented by creating callback members with a specific name:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
    ↪handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
    ↪name, custom_connection_handler)

    def _on_alarm_received(self, handler, ALID, ALCD, ALTX):
        return ACKC5.ACCEPTED
```

In this example when an alarm was received (callback name is `_on_alarm_received`) the `_on_alarm_received` method will be called. The result (in this case `ACKC5.ACCEPTED`) will be passed to the host sending the alarm.

A generic representation of the function would be:

```
def _on_<callback_name>(self, handler, <parameters>):
    return <result>
```

Callbacks for streams/functions can also be overriden this way by following a specific naming:

```
def _on_s05f01(self, handler, packet):
    return self.stream_function(5, 2)(ACKC5.ACCEPTED)
```

Note that the stream and function numbers are formated to have a leading zero if they are only one character long. In this case the reply stream/function must be returned.

Target object

These methods don't need to be implemented on the handler itself. Another object can also be registered using the `callbacks` member names of the handler. The `_on_<callback_name>` methods are then searched in that object:

```
class TestClass(object):
    def _on_alarm_received(self, handler, ALID, ALCD, ALTX):
        return ACKC5.ACCEPTED

t = TestClass()

handler.callbacks.target = t
```

Registering callbacks

Callbacks can also be registered from outside a class:

```
def f_alarm_received(handler, ALID, ALCD, ALTX):
    return ACKC5.ACCEPTED

handler.callbacks.alarm_received = f_alarm_received
```

To unregister simply clear the member:

```
handler.callbacks.alarm_received = None
```

Available callbacks

3.2.1.2 Events

Events will notify the implementation that things happened. They are called asynchronously, the result will be ignored.

There are three ways to define events, by creating them in the *inherited handler*, by setting *target objects* in the handlers events property and by *registering events*.

Inherited handler

When working with a inherited class, events can be implemented by creating members with a specific name:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
    ↪handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
    ↪name, custom_connection_handler)

    def _on_event_hsms_selected(self, connection):
        pass
```

In this example when the hsms connection state changes to selected the `_on_event_hsms_selected` method will be called.

A generic representation of the function would be:

```
def _on_event_<event_name>(self, <parameters>):
    pass
```

To catch all events, the `_on_event` method can be overridden:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
    ↪handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
    ↪name, custom_connection_handler)

    def _on_event(self, *args):
        pass
```

Target objects

These methods don't need to be implemented on the handler itself. Other objects can also be registered using the event member names of the handler. The `_on_event_<event_name>` and `_on_event` methods are then searched in that object:

```
class TestClass(object):
    def _on_event_hsms_selected(self, connection):
        pass

t = TestClass()

handler.events.targets += t
```

The event handler can work with more than one target objects.

Registering events

Events can also be registered from outside a class:

```
def f_hsms_selected(connection):
    pass

handler.events.hsms_selected += f_hsms_selected
```

To unregister simply remove the member:

```
handler.events.hsms_selected -= f_hsms_selected
```

Available events

3.2.2 Implementing a GEM equipment

This package can be used to create a GEM equipment implementation. This is done by subclassing the `secsgem.gem.equipmenthandler.GemEquipmentHandler` class:

```
import secsgem
import code

class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
    ↪handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
        ↪name, custom_connection_handler)

h = SampleEquipment("127.0.0.1", 5000, False, 0, "sampleequipment")
h.enable()

code.interact("equipment object is available as variable 'h', press ctrl-d to stop",_
↪local=locals())

h.disable()
```

3.2.2.1 Using your own name

To use your own modelname and version for S1F14 reply you can override the `secsgem.gem.handler.GemHandler.MDLN` and `secsgem.gem.handler.GemHandler.SOFTREV` members of the GemHandler:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
name, custom_connection_handler)

        self.MDLN = "gemequp"
        self.SOFTREV = "1.0.0"
```

3.2.2.2 Adding status variables

A status variable can be added by inserting an instance of the `secsgem.gem.equipmenthandler.StatusVariable` class to the `secsgem.gem.equipmenthandler.GemEquipmentHandler.status_variables` dictionary:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
name, custom_connection_handler)

        self.status_variables.update({
            10: secsgem.StatusVariable(10, "sample1", numeric SVID, SecsVarU4", "meters
", secsgem.SecsVarU4, False),
            "SV2": secsgem.StatusVariable("SV2", "sample2", text SVID, SecsVarString",
"chars", secsgem.SecsVarString, False),
        })

        self.status_variables[10].value = 123
        self.status_variables["SV2"].value = "sample sv"
```

Alternatively the values can be acquired using a callback by setting the `use_callback` parameter of the constructor to True:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
name, custom_connection_handler)

        self.sv1 = 123
        self.sv2 = "sample sv"

        self.status_variables.update({
            10: secsgem.StatusVariable(10, "sample1", numeric SVID, SecsVarU4", "meters
", secsgem.SecsVarU4, True),
            "SV2": secsgem.StatusVariable("SV2", "sample2", text SVID, SecsVarString",
"chars", secsgem.SecsVarString, True),
        })

    def on_sv_value_request(self, svid, sv):
        if sv.svid == 10:
            return sv.value_type(value=self.sv1)
        elif sv.svid == "SV2":
            return sv.value_type(value=self.sv2)
```

(continues on next page)

(continued from previous page)

```
    return []
```

3.2.2.3 Adding equipment constants

An equipment constant can be added by inserting an instance of the `secsgem.gem.equipmenthandler.EquipmentConstant` class to the `secsgem.gem.equipmenthandler.GemEquipmentHandler.status_variables` dictionary:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
    ↵handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
        ↵name, custom_connection_handler)

        self.equipment_constants.update({
            20: secsgem.EquipmentConstant(20, "sample1", numeric ECID, SecsVarU4", 0,_
            ↵500, 50, "degrees", secsgem.SecsVarU4, False),
            "EC2": secsgem.EquipmentConstant("EC2", "sample2", text ECID, SecsVarString
            ↵", "", "", "", "chars", secsgem.SecsVarString, False),
        })

        self.status_variables[20].value = 321
        self.status_variables["EC2"].value = "sample ec"
```

Alternatively the values can be acquired and updated using callbacks by setting the `use_callback` parameter of the constructor to True:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
    ↵handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
        ↵name, custom_connection_handler)

        self.ec1 = 321
        self.ec2 = "sample ec"

        self.equipment_constants.update({
            20: secsgem.EquipmentConstant(20, "sample1", numeric ECID, SecsVarU4", 0,_
            ↵500, 50, "degrees", secsgem.SecsVarU4, True),
            "EC2": secsgem.EquipmentConstant("EC2", "sample2", text ECID, SecsVarString
            ↵", "", "", "", "chars", secsgem.SecsVarString, True),
        })

    def on_ec_value_request(self, ecid, ec):
        if ec.ecid == 20:
            return ec.value_type(value=self.ec1)
        elif ec.ecid == "EC2":
            return ec.value_type(value=self.ec2)

        return []

    def on_ec_value_update(self, ecid, ec, value):
        if ec.ecid == 20:
            self.ec1 = value
```

(continues on next page)

(continued from previous page)

```
elif ec.ecid == "EC2":
    self.ec2 = value
```

3.2.2.4 Adding collection events

A collection event can be added by inserting an instance of the `secsgem.gem.equipmenthandler.CollectionEvent` class to the `secsgem.gem.equipmenthandler.GemEquipmentHandler.collection_events` dictionary. Data values can be added by inserting an instance of the `secsgem.gem.equipmenthandler.DataValue` class to the `secsgem.gem.equipmenthandler.GemEquipmentHandler.data_values` dictionary. The data values for a collection event can be passed while creating the `secsgem.gem.equipmenthandler.CollectionEvent` instance:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
name, custom_connection_handler)

        self.dv1 = 31337

        self.data_values.update({
            30: secsgem.DataValue(30, "sample1", numeric DV, SecsVarU4, secsgem.
SecsVarU4, True),
        })

        self.collection_events.update({
            50: secsgem.CollectionEvent(50, "test collection event", [30]),
        })

    def on_dv_value_request(self, dvid, dv):
        if dv.dvid == 30:
            return dv.value_type(value=self.dv1)

        return []

    def trigger_sample_collection_event():
        self.trigger_collection_events([50])
```

3.2.2.5 Adding alarms

An alarm can be added by inserting an instance of the `secsgem.gem.equipmenthandler.Alarm` class to the `secsgem.gem.equipmenthandler.GemEquipmentHandler.alarms` dictionary. The collection events for the alarm must be provided when adding the alarm. For an example see the section above:

```
class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
name, custom_connection_handler)

        self.collection_events.update({
            100025: secsgem.CollectionEvent(100025, "test collection event alarm set",
        [ ]),
```

(continues on next page)

(continued from previous page)

```

    200025: secsgem.CollectionEvent(200025, "test collection event alarm clear
˓→", []),
        })

        self.alarms.update({
            25: secsgem.Alarm(25, "test alarm", "test text", secsgem.ALCD.PERSONAL_
˓→SAFETY | secsgem.ALCD.EQUIPMENT_SAFETY, 100025, 200025),
        })

    def set_sample_alarm():
        self.set_alarm(25)

    def clear_sample_alarm():
        self.clear_alarm(25)

```

3.2.2.6 Adding remote commands

A remote command can be added by inserting an instance of the `secsgem.gem.equipmenthandler.RemoteCommand` class to the `secsgem.gem.equipmenthandler.GemEquipmentHandler.remote_commands` dictionary. The collection event and parameters for the remote command must be provided when adding it. For an example see the section above:

```

class SampleEquipment(secsgem.GemEquipmentHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
˓→handler=None):
        secsgem.GemEquipmentHandler.__init__(self, address, port, active, session_id,_
˓→name, custom_connection_handler)

        self.collection_events.update({
            5001: secsgem.CollectionEvent(5001, "TEST_RCMD complete", []),
        })
        self.remote_commands.update({
            "TEST_RCMD": secsgem.RemoteCommand("TEST_RCMD", "test rcmd", ["TEST_"
˓→PARAMETER"], 5001),
        })

    def on_rcmd_TEST_RCMD(self, TEST_PARAMETER):
        print "remote command TEST_RCMD received"

```

3.2.3 Custom streams and functions

3.2.3.1 Custom data item

A new data item is created by overriding the `DataItemBase` class:

```

class UNITS_New(DataItemBase):
    __type__ = SecsVarDynamic
    __allowedtypes__ = [SecsVarArray, SecsVarBoolean, SecsVarU1, SecsVarU2, SecsVarU4,
˓→ SecsVarU8, SecsVarI1, SecsVarI2, SecsVarI4, SecsVarI8, \
        SecsVarF4, SecsVarF8, SecsVarString, SecsVarBinary]

```

In this case the `UNITS` field allows all types instead only a string.

3.2.3.2 Custom stream function

To integrate this new data item in a stream function then you need to inherit `secsgem.secs.functionbase.SecsStreamFunction`

```
class SecsS01F12_New(secsgem.SecsStreamFunction):
    _stream = 1
    _function = 12

    _dataFormat = [
        [
            SVID,
            SVNAME,
            UNITS_New
        ]
    ]

    _toHost = True
    _toEquipment = False

    _hasReply = False
    _isReplyRequired = False

    _isMultiBlock = True
```

3.2.3.3 Integrate a stream function

Now we want to integrate this stream/function into the `secsgem.gem.handler.GemHandler`. You create a new class inherited from it and update the function list of that class:

```
class NewHandler(secsgem.GemHostHandler):
    def __init__(self, address, port, active, session_id, name, custom_connection_
    ↵handler=None):
        secsgem.GemHostHandler.__init__(self, address, port, active, session_id, name,
    ↵ custom_connection_handler)

        self.secsStreamsFunctions[1].update({
            12: SecsS01F12_New,
        })
```

You can also add new methods and properties to the class if required.

This new class can be used with the `secsgem.hsms.connectionmanager.HsmsConnectionManager` (see parameter `connection_handler` of `secsgem.hsms.connectionmanager.HsmsConnectionManager.add_peer()`)

3.2.4 Testing

secsgem can be used to make unit tests on your implementation of the SEMI standard.

Example:

```
import unittest

import secsgem
```

(continues on next page)

(continued from previous page)

```

class TestExampleSecsGem(unittest.TestCase):
    def setUp(self):
        self.connection = secsgem.GemHostHandler("10.211.55.33", 5000, False, 0, "test"
                                                "↔")

        self.connection.enable()
        self.connection.waitfor_communicating()

    def tearDown(self):
        self.connection.disable()

    def testLinktest(self):
        result_packet = self.connection.send_linktest_req()

        self.assertEqual(result_packet.header.sType, 6)
        self.assertEqual(result_packet.header.sessionID, 65535)

```

See file samples/testExample.py

3.3 GEM

SEMI 30

GEM defines certain behaviors of the equipment and how to use the SECS messages for that purpose.

3.3.1 Handlers

`secsgem.gem.handler.GemHandler` inherits the functionality from `secsgem.secs.handler.SecsHandler` (see [Handler](#)).

To distinguish between host and equipment process there are two specialized types of `secsgem.gem.handler.GemHandler`: `secsgem.gem.hosthandler.GemHostHandler` and `secsgem.gem.equipmenthandler.GemEquipmentHandler`. Use `GemHostHandler` if you want to implement a host system, `GemEquipmentHandler` for a equipment system.

It automatically handles the whole setup and teardown of the link. Incoming collection events and terminal messages are automatically accepted and propagated by events. The setup of collection event reports is also simplified. It has functionality to send remote commands and handling process programs.

The handler also implements a maintains a communication state, which is defined in the standard.

```

>>> client = secsgem.GemHostHandler("10.211.55.33", 5000, False, 0, "test")
>>>
>>> client.enable()
>>> client.waitfor_communicating()
True
>>> client.get_process_program_list()
['test1', 'test2']
>>> client.request_process_program('test1')
This is process program test1
>>> client.disable()

```

Waiting for the communicating state can also be done asynchronous

```
>>> def on_communicating(event, data):
...     print "Communicating"
...
>>> client = secsgem.GemHostHandler("10.211.55.33", 5000, False, 0, "test")
>>> client.events.handler_communicating += on_communicating
>>>
>>> client.enable()
Communicating
>>> client.get_process_program_list()
['test1', 'test2']
>>> client.request_process_program('test1')
This is process program test1
>>> client.disable()
```

Also streams/functions can be sent and received with the handler:

```
>>> f = secsgem.SecsS01F01()  
>>> client.send_and_waitfor_response(f)  
secsgem.hsms.packets.HsmsPacket({'header': secsgem.hsms.packets.HsmsHeader({'function  
˓→': 2, 'stream': 1, 'pType': 0, 'system': 14, 'sessionID': 0, 'requireResponse':  
˓→False, 'sType': 0}), 'data': '\x01\x02A\x06EQUIPMA\x06SV n/a'})
```

3.3.1.1 Events

GemHandler defines a few new events, that can be received with the help of `secsgem.common.EventHandler`:

Event name	Description
handler_communicating	Connection is setup
collection_event_received	Collection event was received
terminal_received	Terminal message was received

For an example on how to use these events see the code fragment in *Handler*.

3.3.2 GEM Compliance

GEM COMPLIANCE STATEMENT			
Fundamental GEM Requirements	Implemented	GEM Compliant	
<i>State Models</i>	Yes ✓	No	No
<i>Equipment Processing States</i>	No	No	
Host-Initiated S1,F13/F14 Scenario	Yes ✓	Yes ✓	
Event Notification	Yes ✓	Yes ✓	
On-Line Identification	Yes ✓	Yes ✓	
Error Messages	Yes ✓	Yes ✓	
<i>Documentation</i>	Yes ✓	No	
<i>Control (Operator Initiated)</i>	Yes ✓	No	
Additional Capabilities	Implemented	GEM Compliant	
Establish Communications	Yes ✓	Yes ✓	
<i>Dynamic Event Report Configuration</i>	Yes ✓	No	
Variable Data Collection	Yes ✓	Yes ✓	
<i>Trace Data Collection</i>	No	No	
Status Data Collection	Yes ✓	Yes ✓	
<i>Alarm Management</i>	Yes ✓	No	
<i>Remote Control</i>	Yes ✓	Yes ✓	
<i>Equipment Constants</i>	Yes ✓	No	
<i>Process Recipe Management</i>	No	No	
<i>Material Movement</i>	No	No	
<i>Equipment Terminal Services</i>	Yes ✓	Yes ✓	
<i>Clock</i>	No	No	
<i>Limits Monitoring</i>	No	No	
<i>Spooling</i>	No	No	
Control (Host-Initiated)	Yes ✓	Yes ✓	

3.3.2.1 State Models

- While the communication and control state models are implemented, especially the control state model needs rework.

3.3.2.2 Equipment Processing States

- Not implemented yet.

3.3.2.3 Documentation

- The documentation isn't complete yet.

3.3.2.4 Control (Operator Initiated)

- Persistence for the ONLINE LOCAL/REMOTE is not yet implemented.
- The final UI (or hardware) needs the buttons required by this section.

3.3.2.5 Dynamic Event Report Configuration

- Persistence for report definitions, report-to-event links and enable status is not yet implemented.

3.3.2.6 Trace Data Collection

- Not implemented yet.

3.3.2.7 Alarm Management

- Persistence of en-/disable states and report definitions is not implemented yet.

3.3.2.8 Remote Control

- The START and STOP remote commands must be implemented to be GEM compliant. Currently only dummy functions are provided

3.3.2.9 Equipment Constants

- Persistence of the equipment constants is not implemented yet.
- Limiting changing equipment to “safe” states is not yet implemented?
- Equipment constant changed collection event is not yet implemented.

3.3.2.10 Process Recipe Management

- Not implemented yet.

3.3.2.11 Material Movement

- Not implemented yet.

3.3.2.12 Equipment Terminal Services

- The UI requirements can't be fulfilled by the library

3.3.2.13 Clock

- Not implemented yet.

3.3.2.14 Limits Monitoring

- Not implemented yet.

3.3.2.15 Spooling

- Not implemented yet.

3.4 SECS

SEMI E5

SECS-II defines the messages the data is transferred in between host and equipment over the HSMS protocol (and SECS-I serial). It specifies data types that contain the data and streams and functions that use these types for specific purposes.

3.4.1 Variables

SECS defines a few types to transmit data in.

Data Type	Class	Code
List	<code>secsgem.secs.variables.SecsVarArray</code>	L
List	<code>secsgem.secs.variables.SecsVarList</code>	L
Binary	<code>secsgem.secs.variables.SecsVarBinary</code>	B
Boolean	<code>secsgem.secs.variables.SecsVarBoolean</code>	TF
ASCII	<code>secsgem.secs.variables.SecsVarString</code>	A
8-Byte integer	<code>secsgem.secs.variables.SecsVarI8</code>	I8
1-Byte integer	<code>secsgem.secs.variables.SecsVarI1</code>	I1
2-Byte integer	<code>secsgem.secs.variables.SecsVarI2</code>	I2
4-Byte integer	<code>secsgem.secs.variables.SecsVarI4</code>	I4
8-Byte float	<code>secsgem.secs.variables.SecsVarF8</code>	F8
4-Byte float	<code>secsgem.secs.variables.SecsVarF4</code>	F8
8-Byte unsigned integer	<code>secsgem.secs.variables.SecsVarU8</code>	U8
1-Byte unsigned integer	<code>secsgem.secs.variables.SecsVarU1</code>	U1
2-Byte unsigned integer	<code>secsgem.secs.variables.SecsVarU2</code>	U2
4-Byte unsigned integer	<code>secsgem.secs.variables.SecsVarU4</code>	U4

Example:

```
>>> secsgem.SecsVarString("TESTString")
<A "TESTString">
>>> secsgem.SecsVarBoolean(True)
<BOOLEAN True >
>>> secsgem.SecsVarU4(1337)
<U4 1337 >
```

3.4.1.1 Type arrays

The numeric types can also be an array of that type:

```
>>> secsgem.SecsVarU1([1, 2, 3, 4])
<U1 1 2 3 4 >
>>> secsgem.SecsVarBoolean([True, False, False, True])
<BOOLEAN True False False True >
```

The length of this array can be fixed with the length parameter:

```
>>> secsgem.SecsVarU1([1, 2, 3], count=3)
<U1 1 2 3 >
>>> secsgem.SecsVarU1([1, 2, 3, 4], count=3)
```

(continues on next page)

(continued from previous page)

```

Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "/home/ext005207/Development/secsgem/secsgem/secs/variables.py", line 1439, in __init__
    self.set(value)
  File "/home/ext005207/Development/secsgem/secsgem/secs/variables.py", line 1537, in set
    raise ValueError("Value longer than {} chars".format(self.count))
ValueError: Value longer than 3 chars

```

```

>>> secsgem.SecsVarString("Hello", count=3).get()
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "/home/ext005207/Development/secsgem/secsgem/secs/variables.py", line 1220, in __init__
    self.set(value)
  File "/home/ext005207/Development/secsgem/secsgem/secs/variables.py", line 1337, in set
    raise ValueError("Value longer than {} chars ({} chars)".format(self.count, len(value)))
ValueError: Value longer than 3 chars (5 chars)

```

3.4.1.2 Getting data

The data can be accessed with the `secsgem.secs.variables.SecsVarU1.get()` method, arrays can be accessed using the index operator:

```

>>> secsgem.SecsVarU1(1).get()
1
>>> secsgem.SecsVarU1([1, 2, 3], count=3).get()
[1, 2, 3]
>>> secsgem.SecsVarU1(1)[0]
1
>>> secsgem.SecsVarU1([1, 2, 3])[1]
2

```

3.4.1.3 Setting data

The data can be set with the `secsgem.secs.variables.SecsVarString.set()` method, arrays can be updated using the index operator:

```

>>> v=secsgem.SecsVarU1([1, 2, 3], count=3)
>>> v.set([3, 2, 1])
>>> v
<U1 3 2 1 >
>>> v[0] = 1
>>> v
<U1 1 2 1 >

```

3.4.1.4 En-/Decoding

The variable types can `secsgem.secs.variables.SecsVarArray.encode()` and `secsgem.secs.variables.SecsVarString.decode()` themselves to ASCII data transferrable with the HSMS protocol:

```
>>> v=secsgem.SecsVarString("Hello")
>>> d=v.encode()
>>> d
'A\x05Hello'
>>> secsgem.format_hex(d)
'41:05:48:65:6c:6c:6f'
>>> v.set("NewText")
>>> v
<A "NewText">
>>> v.decode(d)
7
>>> v
<A "Hello">
```

3.4.1.5 SecsVarArray

`secsgem.secs.variables.SecsVarArray` is a special type for a list of the same type. The items of the array can be accessed with the index operator.

```
>>> v=secsgem.SecsVarArray(secsgem.SecsVarU4)
>>> v.set([1, 2, 3])
>>> v
<L [3]
<U4 1 >
<U4 2 >
<U4 3 >
```

```
>>> v.get() [1, 2, 3] >>> v[1] <U4 2 >
```

A new item can be appended to the array with the `secsgem.secs.variables.SecsVarArray.append()` method.

3.4.1.6 SecsVarList

`secsgem.secs.variables.SecsVarList` is a special type for a list of the different types. The items of the list can be accessed like properties of the object.

An ordered dictionary is required for the creation, because pythons default dictionary will be randomly sorted. Sorting is essential because both peers need to have the data in the same order.

```
>>> v=secsgem.SecsVarList([secsgem.OBJACK, secsgem.SOFTREV])
>>> v.OBJACK=3
>>> v.SOFTREV="Hallo"
>>> v
<L [2]
<U1 3 >
<A "Hallo">
```

```
>      >>>     v.SOFTREV      <A      "Hallo">      >>>     secsgem.format_hex(v.encode())
'01:02:a5:01:03:41:05:48:61:6c:6c:6f'
```

3.4.1.7 SecsVarDynamic

`secsgem.secs.variables.SecsVarDynamic` can take different types, if specified to a certain set of types.

```
>>> v=secsgem.SecsVarDynamic([secsgem.SecsVarString, secsgem.SecsVarU1])
>>> v.set(secsgem.SecsVarString("Hello"))
>>> v
<A "Hello">
>>> v.set(secsgem.SecsVarU1(10))
>>> v
<U1 10 >
>>> v.set(secsgem.SecsVarU4(10))
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
    File "/home/ext005207/Development/secsgem/secsgem/secs/variables.py", line 255, in __set__
      raise ValueError("Unsupported type {} for this instance of SecsVarDynamic, allowed {}".format(value.__class__.__name__, self.types))
ValueError: Unsupported type SecsVarU4 for this instance of SecsVarDynamic, allowed [<class 'secsgem.secs.variables.SecsVarString'>, <class 'secsgem.secs.variables.SecsVarU1'>]
```

3.4.2 Functions

A function is inherited from `secsgem.secs.functionbase.SecsStreamFunction`.

Example:

```
class SecsS02F33(SecsStreamFunction):
    _stream = 2
    _function = 33

    _dataFormat = [
        DATAID,
        [
            [
                RPTID,
                [VID]
            ]
        ]
    ]

    _toHost = False
    _toEquipment = True

    _hasReply = True
    _isReplyRequired = True

    _isMultiBlock = True
```

The data of a function can be read and manipulated with the same functionality as the variables. `secsgem.secs.functionbase.SecsStreamFunction.set()`, `secsgem.secs.functionbase.SecsStreamFunction.get()`, `secsgem.secs.functionbase.SecsStreamFunction.append()`, the index operator and object properties. The objects can also encode and decode themselves.

Usage:

```
>>> f=secsgem.SecSS02F33()
>>> f.DATAID=10
>>> f.DATA.append({"RPTID": 5, "VID": ["Hello", "Hallo"]})
>>> f.DATA.append({"RPTID": 6, "VID": ["1", "2"]})
>>> f
S2F33 W
<L [2]
  <U1 10 >
  <L [2]
  <L [2]
    <U1 5 >
    <L [2]
    <A "Hello">
    <A "Hallo">
  >
>
<L [2]
  <U1 6 >
  <L [2]
  <A "1">
  <A "2">
>
>
> .
>>> f.DATA[1].VID[0]="Goodbye"
>>> f.DATA[1].VID[1]="Auf Wiedersehen"
>>> f
S2F33 W
<L [2]
  <U1 10 >
  <L [2]
  <L [2]
    <U1 5 >
    <L [2]
    <A "Hello">
    <A "Hallo">
  >
>
<L [2]
  <U1 6 >
  <L [2]
  <A "Goodbye">
  <A "Auf Wiedersehen">
>
>
> .
>>> secsgem.format_hex(f.encode())
→'01:02:a5:01:0a:01:02:01:02:a5:01:05:01:02:41:05:48:65:6c:6c:6f:41:05:48:61:6c:6c:6f:01:02:a5:01:00
→'
```

The encoded data can be used as data string in a `secsgem.hsms.packets.HsmsPacket` together with a `secsgem.hsms.packets.HsmsStreamFunctionHeader`. See [Packets](#).

3.4.3 Handler

`secsgem.secs.handler.SecsHandler` inherits the functionality from `secsgem.hsms.handler.HsmsHandler` (see [Handler](#)).

The SecsHandler has additional functionality to add callbacks for specific streams and functions.

```
>>> def s01f13_handler(connection, packet):
...     print "S1F13 received"
...
>>> def on_connect(event, data):
...     print "Connected"
...
>>> client = secsgem.SecsHandler("10.211.55.33", 5000, False, 0, "test")
>>> client.events.hsms_connected += on_connect
>>> client.register_stream_function(1, 13, s01f13_handler)
>>>
>>> client.enable()
Connected
S1F13 received
>>> client.disable()
```

There is also additional functionality concerning collection events, service variables and equipment constants.

3.5 HSMS

SEMI E37

HSMS defines the communication between host and equipment over the TCP protocol. It specifies packets used to initiate and terminate the connection, check if the link is still active and transfer the actual data.

3.5.1 Packets

A HSMS packet `secsgem.hsms.packets.HsmsPacket` consists of a header `secsgem.hsms.packets.HsmsHeader` and a data part represented by a string. The string contains the additional data encoded as ASCII characters for transmission over TCP. The additional data is only required for a stream/function packet.

```
>>> secsgem.hsms.packets.HsmsPacket(secsgem.hsms.packets.HsmsLinktestReqHeader(2))
secsgem.hsms.packets.HsmsPacket({'header': secsgem.hsms.packets.HsmsLinktestReqHeader(
    ↪'function': 0, 'stream': 0, 'pType': 0, 'system': 2, 'sessionID': 65535,
    ↪'requireResponse': False, 'sType': 5}), 'data': '')
```

Every header has a system id to match the response to a certain request. The system id is the first parameter to the headers constructor. The connection keeps track of the system id, a new one can be requested with the `secsgem.hsms.connections.HsmsConnection.get_next_system_counter()` function.

HSMS packet objects can encode themselves with the `secsgem.hsms.packets.HsmsPacket.encode()` function to a string, which can be sent over the TCP connection.

```
>>> packet = secsgem.hsms.packets.HsmsPacket(secsgem.hsms.packets.
    ↪HsmsLinktestReqHeader(2))
>>> secsgem.common.format_hex(packet.encode())
'00:00:00:0a:ff:ff:00:00:00:05:00:00:00:02'
```

The other way around, a HSMS packet object can be created from the ASCII string with the `secsgem.hsms.packets.HsmsPacket.decode()` function.

```
>>> secsgem.hsms.packets.HsmsPacket.decode(packetData)
secsgem.hsms.packets.HsmsPacket({'header': secsgem.hsms.packets.HsmsHeader({'function':
    ↪: 0, 'stream': 0, 'pType': 0, 'system': 2, 'sessionID': 65535, 'requireResponse':_
    ↪False, 'sType': 5}), 'data': ''})
```

There are classes inherited from `secsgem.hsms.packets.HsmsHeader` for all HSMS packet types available:

Type	Class	SType
Select Request	<code>secsgem.hsms.packets.HsmsSelectReqHeader</code>	1
Select Response	<code>secsgem.hsms.packets.HsmsSelectRspHeader</code>	2
Deselect Request	<code>secsgem.hsms.packets.HsmsDeselectReqHeader</code>	3
Deselect Response	<code>secsgem.hsms.packets.HsmsDeselectRspHeader</code>	4
Linktest Request	<code>secsgem.hsms.packets.HsmsLinktestReqHeader</code>	5
Linktest Response	<code>secsgem.hsms.packets.HsmsLinktestRspHeader</code>	6
Reject Request	<code>secsgem.hsms.packets.HsmsRejectReqHeader</code>	7
Separate Request	<code>secsgem.hsms.packets.HsmsSeparateReqHeader</code>	9
Data Message	<code>secsgem.hsms.packets.HsmsStreamFunctionHeader</code>	0

3.5.1.1 Select Request

Establish HSMS communication

```
>>> secsgem.hsms.packets.HsmsSelectReqHeader(14)
secsgem.hsms.packets.HsmsSelectReqHeader({'function': 0, 'stream': 0, 'pType': 0,
    ↪'system': 14, 'sessionID': 65535, 'requireResponse': False, 'sType': 1})
```

3.5.1.2 Select Response

Result of select request

```
>>> secsgem.hsms.packets.HsmsSelectRspHeader(24)
secsgem.hsms.packets.HsmsSelectRspHeader({'function': 0, 'stream': 0, 'pType': 0,
    ↪'system': 24, 'sessionID': 65535, 'requireResponse': False, 'sType': 2})
```

3.5.1.3 Deselect Request

Graceful close HSMS communication before disconnecting

```
>>> secsgem.hsms.packets.HsmsDeselectReqHeader(1)
secsgem.hsms.packets.HsmsDeselectReqHeader({'function': 0, 'stream': 0, 'pType': 0,
    ↪'system': 1, 'sessionID': 65535, 'requireResponse': False, 'sType': 3})
```

3.5.1.4 Deselect Response

Result of deselect request

```
>>> secsgem.hsms.packets.HsmsDeselectRspHeader(1)
secsgem.hsms.packets.HsmsDeselectRspHeader({'function': 0, 'stream': 0, 'pType': 0,
                                         'system': 1, 'sessionID': 65535, 'requireResponse': False, 'sType': 4})
```

3.5.1.5 Linktest Request

Check the HSMS connection link is good

```
>>> secsgem.hsms.packets.HsmsLinktestReqHeader(2)
secsgem.hsms.packets.HsmsLinktestReqHeader({'function': 0, 'stream': 0, 'pType': 0,
                                         'system': 2, 'sessionID': 65535, 'requireResponse': False, 'sType': 5})
```

3.5.1.6 Linktest Response

Result of linktest request

```
>>> secsgem.hsms.packets.HsmsLinktestRspHeader(10)
secsgem.hsms.packets.HsmsLinktestRspHeader({'function': 0, 'stream': 0, 'pType': 0,
                                         'system': 10, 'sessionID': 65535, 'requireResponse': False, 'sType': 6})
```

3.5.1.7 Reject Request

Response to unsupported HSMS message

```
>>> secsgem.hsms.packets.HsmsRejectReqHeader(17, 3, 4)
secsgem.hsms.packets.HsmsRejectReqHeader({'function': 4, 'stream': 3, 'pType': 0,
                                         'system': 17, 'sessionID': 65535, 'requireResponse': False, 'sType': 7})
```

3.5.1.8 Separate Request

Immediate termination of the HSMS connection

```
>>> secsgem.hsms.packets.HsmsSeparateReqHeader(17)
secsgem.hsms.packets.HsmsSeparateReqHeader({'function': 0, 'stream': 0, 'pType': 0,
                                         'system': 17, 'sessionID': 65535, 'requireResponse': False, 'sType': 9})
```

3.5.1.9 Data Message

Secs stream and function message

```
>>> secsgem.hsms.packets.HsmsStreamFunctionHeader(22, 1, 1, True, 100)
secsgem.hsms.packets.HsmsStreamFunctionHeader({'function': 1, 'stream': 1, 'pType': 0,
                                         'system': 22, 'sessionID': 100, 'requireResponse': True, 'sType': 0})
```

3.5.2 Connections

HSMS has active and passive connections. The active connection is the one making the connection, the passive one is waiting for the incoming connection.

The implementation for the active connection is `secsgem.hsms.connections.HsmsActiveConnection`. For the passive connection there are two implementations:

- `secsgem.hsms.connections.HsmsPassiveConnection` handles only one connection at a time.
- `secsgem.hsms.connections.HsmsMultiPassiveConnection` together with `secsgem.hsms.connections.HsmsMultiPassiveServer` handle multiple connections from different peers.

All connection classes are based on the `secsgem.hsms.connections.HsmsConnection` class, which provides common functionality for all connection types.

The connection process for active and passive connections can be started with the `secsgem.hsms.connections.HsmsPassiveConnection.enable()` function, and stopped with the `secsgem.hsms.connections.HsmsPassiveConnection.disable()` function.

3.5.2.1 Delegates

All connections work with delegates. When a connection is established/terminated or a packet is received a method of the passed delegate object will be called. The connections support the following delegates:

- `on_connection_established(connection)`
- `on_connection_packet_received(response)`
- `on_connection_before_closed(connection)`
- `on_connection_closed(connection)`

Sample delegate class:

```
class DelegateSample:  
    def on_connection_established(self, connection):  
        print "Connection established"  
  
    def on_connection_packet_received(self, connection, packet):  
        print "Packet received", packet  
  
    def on_connection_before_closed(self, connection):  
        print "Connection about to be terminated"  
  
    def on_connection_closed(self, connection):  
        print "Connection terminated"
```

3.5.2.2 Active connection

For the active connection the first parameter is the IP address of the peer, the second parameter is the port of the peer. The third parameter is the session id the peer is configured for.

Example:

```
>>> delegate = DelegateSample()  
>>> conn = secsgem.HsmsActiveConnection('10.211.55.33', 5000, 0, delegate)  
>>> conn.enable()  
Connection established  
Packet received header: {sessionID:0x0000, stream:00, function:04, pType:0x00, ↴  
  sType:0x07, system:0x00000000, requireResponse:0}  
Packet received header: {sessionID:0x0000, stream:00, function:01, pType:0x00, ↴  
  sType:0x07, system:0x00000000, requireResponse:0}
```

(continues on next page)

(continued from previous page)

```
Connection about to be terminated
Connection terminated
>>> conn.disable()
```

3.5.2.3 Passive connection

For the passive connection the first parameter is the expected IP address of the peer, the second parameter is the port to listen on. The third parameter is the session id the peer is configured for.

Example:

```
>>> delegate = DelegateSample()
>>> conn = secsgem.HsmsPassiveConnection('10.211.55.33', 5000, 0, delegate)
>>> conn.enable()
Connection established
Packet received header: {sessionID:0xffff, stream:00, function:00, pType:0x00, ↵
    ↵sType:0x01, system:0x00000001, requireResponse:0}
Packet received header: {sessionID:0x0000, stream:00, function:03, pType:0x00, ↵
    ↵sType:0x07, system:0x00000000, requireResponse:0}
Connection about to be terminated
Connection terminated
>>> conn.disable()
```

3.5.2.4 Multi-passive connection

In this mode one listening port handles the incoming connections for more than one peer. A instance of `secsgem.hsms.connections.HsmsMultiPassiveServer` is created and connection is created using its `secsgem.hsms.connections.HsmsMultiPassiveServer.create_connection()` method. The parameters of the method are the same as for the *Passive connection*. For every available peer a connection must be created using this method.

Example:

```
>>> delegate = DelegateSample()
>>> server = secsgem.HsmsMultiPassiveServer(5000)
>>> conn = server.create_connection('10.211.55.33', 5000, 0, delegate)
>>> conn.enable()
>>> server.start()
Connection established
Packet received header: {sessionID:0xffff, stream:00, function:00, pType:0x00, ↵
    ↵sType:0x01, system:0x00000003, requireResponse:0}
Packet received header: {sessionID:0x0000, stream:00, function:03, pType:0x00, ↵
    ↵sType:0x07, system:0x00000000, requireResponse:0}
Connection about to be terminated
Connection terminated
>>> conn.disable()
>>> server.stop()
```

3.5.2.5 Connection manager

The `secsgem.hsms.connectionmanager.HsmsConnectionManager` can be used to manage multiple active and passive connections. It creates and removes `secsgem.hsms.connections.HsmsActiveConnection` and `secsgem.hsms.connections.HsmsPassiveConnection`.

HsmsMultiPassiveServer/*secsgem.hsms.connections.HsmsMultiPassiveConnection* dynamically.

```
>>> manager=secsgem.HsmsConnectionManager()
>>> handler=manager.add_peer("connection", '10.211.55.33', 5000, False, 0)
>>> handler.enable()
>>> handler.send_linktest_req()
secsgem.hsms.packets.HsmsPacket({'header': secsgem.hsms.packets.HsmsHeader({'function
˓→': 0, 'stream': 0, 'pType': 0, 'system': 13, 'sessionID': 65535, 'requireResponse':_
˓→False, 'sType': 6}), 'data': ''})
>>> handler.disable()
>>> manager.stop()
```

Connection manager works with *handlers* which take care of a lot of the required communication on the matching level (*secsgem.hsms.handler.HsmsHandler*, *secsgem.secs.handler.SecsHandler* and *secsgem.gem.handler.GemHandler*).

3.5.3 Handler

secsgem.hsms.handler.HsmsHandler has the basic HSMS connection handling build in. It automatically selects and deselects the link and performs a periodic linktest. It also replies to incoming HSMS requests like linktest automatically.

```
>>> def on_connect(event, data):
...     print "Connected"
...
>>> client = secsgem.HsmsHandler("10.211.55.33", 5000, False, 0, "test")
>>> client.events.hsms_connected += on_connect
>>> client.enable()
Connected
>>> client.send_linktest_req()
secsgem.hsms.packets.HsmsPacket({'header': secsgem.hsms.packets.HsmsHeader({'function
˓→': 0, 'stream': 0, 'pType': 0, 'system': 7, 'sessionID': 65535, 'requireResponse':_
˓→False, 'sType': 6}), 'data': ''})
>>> client.disable()
```

The handler has functions to send requests and responses and wait for a certain response.

3.5.3.1 Events

Events of the handler can be received with the help of *secsgem.common.EventHandler*. The handler sends the following events:

Event name	Description
hsms_connected	Connection was established
hsms_selected	Connection was selected
hsms_disconnected	Connection was terminated

For an example on how to use these events see the code fragment above.

3.6 Class reference

3.6.1 HSMS

3.6.1.1 Packets

class secsgem.hsms.packets.HsmsPacket (*header=None, data=b''*)

Bases: object

Class for hsms packet.

Contains all required data and functions.

encode()

Encode packet data to hsms packet.

Returns encoded packet

Return type string

Example:

```
>>> import secsgem
>>>
>>> packet = secsgem.hsms.packets.HsmsPacket(secsgem.hsms.packets.
...     ↳HsmsLinktestReqHeader(2))
>>> secsgem.common.format_hex(packet.encode())
'00:00:00:0a:ff:ff:00:00:00:05:00:00:00:02'
```

static decode(*text*)

Decode byte array hsms packet to HsmsPacket object.

Returns received packet object

Return type secsgem.hsms.packets.HsmsPacket

Example:

```
>>> import secsgem
>>>
>>> packetData = b"\x00\x00\x00\x0b\xff\xff\x00\x00\x00\x05\x00\x00\x00\x02"
>>>
>>> secsgem.format_hex(packetData)
'00:00:00:0b:ff:ff:00:00:00:05:00:00:00:02'
>>>
>>> secsgem.hsms.packets.HsmsPacket.decode(packetData)
HsmsPacket({'header': HsmsHeader({sessionID:0xffff, stream:00, function:00,
...     ↳pType:0x00, sType:0x05, system:0x00000002, requireResponse:False}), 'data':
...     ↳''})
```

class secsgem.hsms.packets.HsmsHeader (*system, session_id*)

Bases: object

Generic HSMS header.

Base for different specific headers

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.**HsmsStreamFunctionHeader**(*system*, *stream*, *function*, *require_response*, *session_id*)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for SECS message.

Header for message with SType 0.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.**HsmsSelectReqHeader**(*system*)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Select Request.

Header for message with SType 1.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.**HsmsSelectRspHeader**(*system*)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Select Response.

Header for message with SType 2.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.**HsmsDeselectReqHeader** (system)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Deselect Request.

Header for message with SType 3.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.**HsmsDeselectRspHeader** (system)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Deselect Response.

Header for message with SType 4.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.**HsmsLinktestReqHeader** (system)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Linktest Request.

Header for message with SType 5.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.HsmsLinktestRspHeader(system)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Linktest Response.

Header for message with SType 6.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.HsmsRejectReqHeader(system, s_type, reason)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Reject Request.

Header for message with SType 7.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

class secsgem.hsms.packets.HsmsSeparateReqHeader(system)

Bases: *secsgem.hsms.packets.HsmsHeader*

Header for Separate Request.

Header for message with SType 9.

encode()

Encode header to hsms packet.

Returns encoded header

Return type string

Example:

```
>>> import secsgem
>>>
>>> header = secsgem.hsms.packets.HsmsLinktestReqHeader(2)
>>> secsgem.common.format_hex(header.encode())
'ff:ff:00:00:00:05:00:00:00:02'
```

3.6.1.2 Connections

class secsgem.hsms.connections.**HsmsConnection**(active, address, port, session_id=0, delegate=None)

Bases: object

Connection class used for active and passive hsms connections.

selectTimeout = 0.5

Timeout for select calls .

sendBlockSize = 1048576

Block size for outbound data .

T3 = 45.0

Reply Timeout .

T5 = 10.0

Connect Separation Time .

T6 = 5.0

Control Transaction Timeout .

disconnect()

Close connection.

send_packet(packet)

Send the ASCII coded packet to the remote host.

Parameters **packet** (string / byte array) – encoded data to be transmitted

class secsgem.hsms.connections.**HsmsActiveConnection**(address, port=5000, session_id=0, delegate=None)

Bases: secsgem.hsms.connections.HsmsConnection

Client class for single active (outgoing) connection.

T3 = 45.0

T5 = 10.0

T6 = 5.0

disconnect()

Close connection.

selectTimeout = 0.5

sendBlockSize = 1048576

send_packet (packet)

Send the ASCII coded packet to the remote host.

Parameters **packet** (*string / byte array*) – encoded data to be transmitted

enable ()

Enable the connection.

Starts the connection process to the passive remote.

disable ()

Disable the connection.

Stops all connection attempts, and closes the connection

class `secsgem.hsms.connections.HsmsPassiveConnection (address, port=5000, session_id=0, delegate=None)`

Bases: `secsgem.hsms.connections.HsmsConnection`

Server class for single passive (incoming) connection.

Creates a listening socket and waits for one incoming connection on this socket. After the connection is established the listening socket is closed.

enable ()

Enable the connection.

Starts the connection process to the passive remote.

disable ()

Disable the connection.

Stops all connection attempts, and closes the connection

T3 = 45.0

T5 = 10.0

T6 = 5.0

disconnect ()

Close connection.

selectTimeout = 0.5

sendBlockSize = 1048576

send_packet (packet)

Send the ASCII coded packet to the remote host.

Parameters **packet** (*string / byte array*) – encoded data to be transmitted

class `secsgem.hsms.connections.HsmsMultiPassiveConnection (address, port=5000, session_id=0, delegate=None)`

Bases: `secsgem.hsms.connections.HsmsConnection`

Connection class for single connection from `secsgem.hsms.connections.HsmsMultiPassiveServer`.

Handles connections incoming connection from `secsgem.hsms.connections.HsmsMultiPassiveServer`

on_connected (sock, address)

Connected callback for `secsgem.hsms.connections.HsmsMultiPassiveServer`.

Parameters

- **sock** (`Socket`) – Socket for new connection
- **address** (`string`) – IP address of remote host

enable()

Enable the connection.

Starts the connection process to the passive remote.

disable()

Disable the connection.

Stops all connection attempts, and closes the connection

T3 = 45.0**T5 = 10.0****T6 = 5.0****disconnect()**

Close connection.

selectTimeout = 0.5**sendBlockSize = 1048576****send_packet(packet)**

Send the ASCII coded packet to the remote host.

Parameters `packet` (`string / byte array`) – encoded data to be transmitted

class secsgem.hsms.connections.HsmsMultiPassiveServer(port=5000)

Bases: `object`

Server class for multiple passive (incoming) connection.

The server creates a listening socket and waits for incoming connections on this socket.

selectTimeout = 0.5

Timeout for select calls .

create_connection(address, port=5000, session_id=0, delegate=None)

Create and remember connection for the server.

Parameters

- **address** (`string`) – IP address of target host
- **port** (`integer`) – TCP port of target host
- **session_id** (`integer`) – session / device ID to use for connection
- **delegate** (`object`) – target for messages

start()

Starts the server and returns.

It will launch a listener running in background to wait for incoming connections.

stop(terminate_connections=True)

Stops the server. The background job waiting for incoming connections will be terminated.

Optionally all connections received will be closed.

Parameters `terminate_connections` (`boolean`) – terminate all connection made by this server

3.6.1.3 Handler

class `secsgem.hsms.handler.HsmsHandler` (`address, port, active, session_id, name, custom_connection_handler=None`)
Bases: `object`

Baseclass for creating Host/Equipment models.

This layer contains the HSMS functionality. Inherit from this class and override required functions.

events

Property for event handling.

callbacks

Property for callback handling.

get_next_system_counter()

Returns the next System.

Returns System for the next command

Return type integer

on_connection_established(_)

Connection was established.

on_connection_before_closed(_)

Connection is about to be closed.

on_connection_closed(_)

Connection was closed.

on_connection_packet_received(_, packet)

Packet received by connection.

Parameters `packet` (`secsgem.hsms.packets.HsmsPacket`) – received data packet

enable()

Enables the connection.

disable()

Disables the connection.

send_stream_function(packet)

Send the packet and wait for the response.

Parameters `packet` (`secsgem.secs.functionbase.SecsStreamFunction`) – packet to be sent

send_and_waitfor_response(packet)

Send the packet and wait for the response.

Parameters `packet` (`secsgem.secs.functionbase.SecsStreamFunction`) – packet to be sent

Returns Packet that was received

Return type `secsgem.hsms.packets.HsmsPacket`

send_response(function, system)

Send response function for system.

Parameters

- **function** (*secsgem.secs.functionbase.SecsStreamFunction*) – function to be sent
- **system** (*integer*) – system to reply to

send_select_req()

Send a Select Request to the remote host.

Returns System of the sent request

Return type integer

send_select_rsp(*system_id*)

Send a Select Response to the remote host.

Parameters **system_id** (*integer*) – System of the request to reply for

send_linktest_req()

Send a Linktest Request to the remote host.

Returns System of the sent request

Return type integer

send_linktest_rsp(*system_id*)

Send a Linktest Response to the remote host.

Parameters **system_id** (*integer*) – System of the request to reply for

send_deselect_req()

Send a Deselect Request to the remote host.

Returns System of the sent request

Return type integer

send_deselect_rsp(*system_id*)

Send a Deselect Response to the remote host.

Parameters **system_id** (*integer*) – System of the request to reply for

send_reject_rsp(*system_id, s_type, reason*)

Send a Reject Response to the remote host.

Parameters

- **system_id** (*integer*) – System of the request to reply for
- **s_type** (*integer*) – s_type of rejected message
- **reason** (*integer*) – reason for rejection

send_separate_req()

Send a Separate Request to the remote host.

3.6.1.4 ConnectionManager

```
class secsgem.hsms.connectionmanager.HsmsConnectionManager
Bases: object
```

High level class that handles multiple active and passive connections and the model for them.

events

Property for event handling.

has_connection_to (*index*)

Check if connection to certain peer exists.

Parameters **index** (*string*) – Name of the requested handler.

Returns Is peer available

Return type boolean

static get_connection_id (*address*)

Generates connection ids used for internal indexing.

Parameters **address** (*string*) – The IP address for the affected remote.

add_peer (*name*, *address*, *port*, *active*, *session_id*, *connection_handler*=<class 'secs-
gem.hsms.handler.HsmsHandler'>)

Add a new connection.

Parameters

- **name** (*string*) – Name of the peers configuration
- **address** (*string*) – IP address of peer
- **port** (*integer*) – TCP port of peer
- **active** (*boolean*) – Is the connection active (*True*) or passive (*False*)
- **session_id** (*integer*) – session / device ID of peer
- **connection_handler** (inherited from *secsgem.hsms.handler.
HsmsHandler*) – Model handling this connection

remove_peer (*name*, *address*, *port*)

Remove a previously added connection.

Parameters

- **name** (*string*) – Name of the peers configuration
- **address** (*string*) – IP address of peer
- **port** (*integer*) – TCP port of peer

stop()

Stop all servers and terminate the connections.

3.6.2 SECS

3.6.2.1 Variables

SECS variable types.

class secsgem.secs.variables.SecsVar

Bases: object

Base class for SECS variables.

Due to the python types, wrapper classes for variables are required. If constructor is called with SecsVar or subclass only the value is copied.

formatCode = -1

static generate (*dataformat*)

Generate actual variable from data format.

Parameters `dataformat` (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

static get_format (`dataformat, showname=False`)
Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (`value`)
Set the internal value to the provided value.

Parameters `value` (*various*) – new value

encode_item_header (`length`)
Encode item header depending on the number of length bytes required.

Parameters `length` (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

decode_item_header (`data, text_pos=0`)
Encode item header depending on the number of length bytes required.

Parameters

- `data` (*string*) – encoded data
- `text_pos` (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

class `secsgem.secs.variables.SecsVarDynamic` (`types, value=None, count=-1`)
Bases: `secsgem.secs.variables.SecsVar`

Variable with interchangeable type.

set (`value`)
Set the internal value to the provided value.

In doubt provide the variable wrapped in the matching `secsgem.secs.variables.SecsVar` class, to avoid confusion.

Example:

```
>>> import secsgem
>>>
>>> var = secsgem.SecsVarDynamic([secsgem.SecsVarString, secsgem.SecsVarU1])
>>> var.set(secsgem.SecsVarU1(10))
>>> var
<U1 10 >
```

If no type is provided the default type is used which might not be the expected type.

Parameters `value` (*various*) – new value

get()
Return the internal value.

Returns internal value

Return type various

encode()

Encode the value to secs data.

Returns encoded data bytes

Return type string

decode(data, start=0)

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header(data, text_pos=0)

Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode_item_header(length)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

formatCode = -1

static generate(dataformat)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

static get_format(dataformat, showname=False)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

class secsgem.secs.variables.ANYVALUE(value=None)

Bases: *secsgem.secs.variables.SecsVarDynamic*

Dummy data item for generation of unknown types.

Types

- *SecsVarArray*
- *SecsVarBinary*
- *SecsVarBoolean*
- *SecsVarString*
- *SecsVarI8*
- *SecsVarI1*
- *SecsVarI2*
- *SecsVarI4*
- *SecsVarF8*
- *SecsVarF4*
- *SecsVarU8*
- *SecsVarU1*
- *SecsVarU2*
- *SecsVarU4*

decode (*data*, *start*=0)

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data*, *text_pos*=0)

Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode ()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header (*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

formatCode = -1

static generate (*dataformat*)
Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – *dataformat* to create variable for

Returns created variable

Return type SecsVar based class

get()
Return the internal value.

Returns internal value

Return type various

static get_format (*dataformat, showname=False*)
Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (*value*)
Set the internal value to the provided value.

In doubt provide the variable wrapped in the matching `secsgem.secs.variables.SecsVar` class, to avoid confusion.

Example:

```
>>> import secsgem
>>>
>>> var = secsgem.SecsVarDynamic([secsgem.SecsVarString, secsgem.SecsVarU1])
>>> var.set(secsgem.SecsVarU1(10))
>>> var
<U1 10 >
```

If no type is provided the default type is used which might not be the expected type.

Parameters **value** (*various*) – new value

class secsgem.secs.variables.**SecsVarList** (*dataformat, value=None*)
Bases: `secsgem.secs.variables.SecsVar`

List variable type. List with items of different types.

formatCode = 0

textCode = 'L'

preferredTypes = [`<class 'dict'>`]

static get_format (*dataformat, showname=False*)
Gets the format of the variable.

Returns returns the string representation of the function

Return type string

static get_name_from_format (*dataformat*)
Generates a name for the passed dataformat.

Parameters `dataformat` (*list/SecsVar based class*) – dataformat to get name for

Returns name for dataformat

Return type str

set (*value*)
Set the internal value to the provided value.

Parameters `value` (*dict/list*) – new value

get ()
Return the internal value.

Returns internal value

Return type list

encode ()
Encode the value to secs data.

Returns encoded data bytes

Return type string

decode (*data, start=0*)
Decode the secs byte data to the value.

Parameters

- `data` (*string*) – encoded data bytes
- `start` (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data, text_pos=0*)
Encode item header depending on the number of length bytes required.

Parameters

- `data` (*string*) – encoded data
- `text_pos` (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode_item_header (*length*)
Encode item header depending on the number of length bytes required.

Parameters `length` (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (*dataformat*)
Generate actual variable from data format.

Parameters `dataformat` (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

class secsgem.secs.variables.SecsVarArray (*dataFormat*, *value=None*, *count=-1*)

Bases: secsgem.secs.variables.SecsVar

List variable type. List with items of same type.

formatCode = 0

textCode = 'L'

preferredTypes = [<class 'list'>]

static get_format (*dataformat*, *showname=False*)

Gets the format of the variable.

Returns returns the string representation of the function

Return type string

append (*data*)

Append data to the internal list.

Parameters **value** (*various*) – new value

set (*value*)

Set the internal value to the provided value.

Parameters **value** (*list*) – new value

get ()

Return the internal value.

Returns internal value

Return type list

encode ()

Encode the value to secs data.

Returns encoded data bytes

Return type string

decode (*data*, *start=0*)

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data*, *text_pos=0*)

Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode_item_header (*length*)
 Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (*dataformat*)
 Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

```
class secsgem.secs.variables.SecsVarBinary (value=None, count=-1)
Bases: secsgem.secs.variables.SecsVar
```

Secs type for binary data.

```
formatCode = 8
textCode = 'B'
preferredTypes = [<class 'bytes'>, <class 'bytarray'>]
supports_value (value)
  Check if the current instance supports the provided value.
```

Parameters **value** (*any*) – value to test

```
set (value)
  Set the internal value to the provided value.
```

Parameters **value** (*string/integer*) – new value

```
get ()
  Return the internal value.
```

Returns internal value

Return type list/integer

```
encode ()
  Encode the value to secs data.
```

Returns encoded data bytes

Return type string

```
decode (data, start=0)
  Decode the secs byte data to the value.
```

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data, text_pos=0*)
Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode_item_header (*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (*dataformat*)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

static get_format (*dataformat, showname=False*)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

class secsgem.secs.variables.SecsVarBoolean (*value=None, count=-1*)

Bases: *secsgem.secs.variables.SecsVar*

Secs type for boolean data.

formatCode = 9

textCode = 'BOOLEAN'

preferredTypes = [<class 'bool'>]

supports_value (*value*)

Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

set (*value*)

Set the internal value to the provided value.

Parameters **value** (*list/boolean*) – new value

get ()

Return the internal value.

Returns internal value

Return type list/boolean

encode()
Encode the value to secs data.

Returns encoded data bytes

Return type string

decode(data, start=0)
Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header(data, text_pos=0)
Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode_item_header(length)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate(dataformat)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

static get_format(dataformat, showname=False)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

class secsgem.secs.variables.SecsVarText(*value=”, count=-1*)

Bases: *secsgem.secs.variables.SecsVar*

Secs type base for any text data.

formatCode = -1

textCode = ''

controlChars = '\x00\x01\x02\x03\x04\x05\x06\x07\x08\t\n\x0b\x0c\r\x0e\x0f\x10\x11\x12'

```
coding = ''
```

supports_value (*value*)
Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

set (*value*)
Set the internal value to the provided value.

Parameters **value** (*string/integer*) – new value

get ()
Return the internal value.

Returns internal value

Return type string

encode ()
Encode the value to secs data.

Returns encoded data bytes

Return type string

decode (*data, start=0*)
Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data, text_pos=0*)
Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode_item_header (*length*)
Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (*dataformat*)
Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

static get_format(*dataformat*, *showname*=*False*)
Gets the format of the function.

Returns returns the string representation of the function

Return type string

```
class secsgem.secs.variables.SecsVarString(value='', count=-1)
```

Bases: `secsgem.secs.variables.SecsVarText`

Secs type for string data.

Parameters

- **value** (*string*) – initial value
 - **count** (*integer*) – number of items this value

formatCode = 16

```
textCode = 'A'
```

```
preferredTypes = []
```

```
coding = 'latin-1'
```

decode (*data*, *start*=0)

Decode the secs byte data to t

Parameters

- **data** (*string*) – encode
- **start** (*integer*) – start

Returns new start position

Return type integer

decode_item_header (*data*, *text_pos*=0)

Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
 - **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode ()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header(*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate(dataformat)

Generate actual variable from data format.

Parameters dataformat (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get()

Return the internal value.

Returns internal value

Return type string

static get_format(dataformat, showname=False)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set(value)

Set the internal value to the provided value.

Parameters value (*string/integer*) – new value

supports_value(value)

Check if the current instance supports the provided value.

Parameters value (*any*) – value to test

class secsgem.secs.variables.SecsVarJIS8(*value=”, count=-1*)

Bases: *secsgem.secs.variables.SecsVarText*

Secs type for string data.

Parameters

- **value** (*string*) – initial value
- **count** (*integer*) – number of items this value

formatCode = 17

textCode = 'J'

preferredTypes = [*<class 'bytes'>, <class 'str'>*]

controlChars = '\x00\x01\x02\x03\x04\x05\x06\x07\x08\t\x0b\x0c\x0e\x0f\x10\x11\x12

coding = 'jis-8'

decode(data, start=0)

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data, text_pos=0*)
 Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode ()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header (*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (*dataformat*)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get ()

Return the internal value.

Returns internal value

Return type string

static get_format (*dataformat, showname=False*)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (*value*)

Set the internal value to the provided value.

Parameters **value** (*string/integer*) – new value

supports_value (*value*)

Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

class secsgem.secs.variables.**SecsVarNumber** (*value=None, count=-1*)

Bases: *secsgem.secs.variables.SecsVar*

Secs base type for numeric data.

```
formatCode = 0
textCode = ''
supports_value(value)
    Check if the current instance supports the provided value.

    Parameters value (any) – value to test

set(value)
    Set the internal value to the provided value.

    Parameters value (list/integer/float) – new value

get()
    Return the internal value.

    Returns internal value

    Return type list/integer/float

encode()
    Encode the value to secs data.

    Returns encoded data bytes

    Return type string

decode(data, start=0)
    Decode the secs byte data to the value.

    Parameters

        • data (string) – encoded data bytes

        • start (integer) – start position of value the data

    Returns new start position

    Return type integer

decode_item_header(data, text_pos=0)
    Encode item header depending on the number of length bytes required.

    Parameters

        • data (string) – encoded data

        • text_pos (integer) – start of item header in data

    Returns start position for next item, format code, length item of data

    Return type (integer, integer, integer)

encode_item_header(length)
    Encode item header depending on the number of length bytes required.

    Parameters length (integer) – number of bytes in data

    Returns encoded item header bytes

    Return type string

static generate(dataformat)
    Generate actual variable from data format.

    Parameters dataformat (list/SecsVar based class) – dataformat to create variable for
```

Returns created variable

Return type SecsVar based class

static get_format (*dataformat*, *showname=False*)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

class secsgem.secs.variables.**SecsVarI8** (*value=None*, *count=-1*)

Bases: *secsgem.secs.variables.SecsVarNumber*

Secs type for 8 byte signed data.

Parameters

- **value** (*list/integer*) – initial value
- **count** (*integer*) – number of items this value

formatCode = 24

textCode = 'I8'

preferredTypes = [<class 'int'>]

decode (*data*, *start=0*)

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data*, *text_pos=0*)

Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode ()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header (*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

```
static generate (dataformat)
Generate actual variable from data format.

Parameters dataformat (list/SecsVar based class) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get ()
Return the internal value.

Returns internal value

Return type list/integer/float

static get_format (dataformat, showname=False)
Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (value)
Set the internal value to the provided value.

Parameters value (list/integer/float) – new value

supports_value (value)
Check if the current instance supports the provided value.

Parameters value (any) – value to test

class secsgem.secs.variables.SecsVarI1 (value=None, count=-1)
Bases: secsgem.secs.variables.SecsVarNumber

Secs type for 1 byte signed data.

Parameters

- value (list/integer) – initial value
- count (integer) – number of items this value

formatCode = 25
textCode = 'I1'
preferredTypes = [<class 'int'>]
decode (data, start=0)
Decode the secs byte data to the value.

Parameters

- data (string) – encoded data bytes
- start (integer) – start position of value the data

Returns new start position

Return type integer

decode_item_header (data, text_pos=0)
Encode item header depending on the number of length bytes required.

Parameters
```

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header(*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate(*dataformat*)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get()

Return the internal value.

Returns internal value

Return type list/integer/float

static get_format(*dataformat*, *showname=False*)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set(*value*)

Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value(*value*)

Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

class secsgem.secs.variables.SecsVarI2 (*value=None, count=-1*)

Bases: *secsgem.secs.variables.SecsVarNumber*

Secs type for 2 byte signed data.

Parameters

- **value** (*list/integer*) – initial value
- **count** (*integer*) – number of items this value

```
formatCode = 26
textCode = 'I2'
preferredTypes = [<class 'int'>]
decode(data, start=0)
    Decode the secs byte data to the value.
```

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

```
decode_item_header(data, text_pos=0)
    Encode item header depending on the number of length bytes required.
```

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

```
encode()
```

Encode the value to secs data.

Returns encoded data bytes

Return type string

```
encode_item_header(length)
```

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

```
static generate(dataformat)
```

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

```
get()
```

Return the internal value.

Returns internal value

Return type list/integer/float

```
static get_format(dataformat, showname=False)
```

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (*value*)
Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value (*value*)
Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

```
class secsgem.secs.variables.SecsVarI4 (value=None, count=-1)
Bases: secsgem.secs.variables.SecsVarNumber
```

Secs type for 4 byte signed data.

Parameters

- **value** (*list/integer*) – initial value
- **count** (*integer*) – number of items this value

```
formatCode = 28
textCode = 'I4'
preferredTypes = [<class 'int'>]
```

decode (*data, start=0*)
Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data, text_pos=0*)
Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode ()
Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header (*length*)
Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate(*dataformat*)
Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – *dataformat* to create variable for

Returns created variable

Return type SecsVar based class

get()
Return the internal value.

Returns internal value

Return type list/integer/float

static get_format(*dataformat, showname=False*)
Gets the format of the function.

Returns returns the string representation of the function

Return type string

set(*value*)
Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value(*value*)
Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

class secsgem.secs.variables.SecsVarF8(*value=None, count=-1*)
Bases: *secsgem.secs.variables.SecsVarNumber*

Secs type for 8 byte float data.

Parameters

- **value** (*list/float*) – initial value
- **count** (*integer*) – number of items this value

formatCode = 32

textCode = 'F8'

preferredTypes = [*<class 'float'>*]

decode(*data, start=0*)
Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header(*data, text_pos=0*)
Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header(*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate(*dataformat*)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get()

Return the internal value.

Returns internal value

Return type list/integer/float

static get_format(*dataformat*, *showname=False*)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set(*value*)

Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value(*value*)

Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

class secsgemsecsvariables.SecsVarF4(*value=None, count=-1*)

Bases: *secsgemsecsvariables.SecsVarNumber*

Secs type for 4 byte float data.

Parameters

- **value** (*list/float*) – initial value

- **count** (*integer*) – number of items this value

```
formatCode = 36
textCode = 'F4'
preferredTypes = [<class 'float'>]
decode(data, start=0)
```

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

```
decode_item_header(data, text_pos=0)
```

Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

```
encode()
```

Encode the value to secs data.

Returns encoded data bytes

Return type string

```
encode_item_header(length)
```

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

```
static generate(dataformat)
```

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

```
get()
```

Return the internal value.

Returns internal value

Return type list/integer/float

```
static get_format(dataformat, showname=False)
```

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (*value*)
Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value (*value*)
Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

```
class secsgem.secs.variables.SecsVarU8 (value=None, count=-1)
Bases: secsgem.secs.variables.SecsVarNumber
```

Secs type for 8 byte unsigned data.

Parameters

- **value** (*list/integer*) – initial value
- **count** (*integer*) – number of items this value

```
formatCode = 40
textCode = 'U8'
preferredTypes = [<class 'int'>]
decode (data, start=0)
Decode the secs byte data to the value.
```

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

```
decode_item_header (data, text_pos=0)
Encode item header depending on the number of length bytes required.
```

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

```
encode ()
Encode the value to secs data.
```

Returns encoded data bytes

Return type string

```
encode_item_header (length)
Encode item header depending on the number of length bytes required.
```

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (dataformat)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get ()

Return the internal value.

Returns internal value

Return type list/integer/float

static get_format (dataformat, showname=False)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (value)

Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value (value)

Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

class secsgem.secs.variables.SecsVarU1 (*value=None, count=-1*)

Bases: *secsgem.secs.variables.SecsVarNumber*

Secs type for 1 byte unsigned data.

Parameters

- **value** (*list/integer*) – initial value
- **count** (*integer*) – number of items this value

formatCode = 41

textCode = 'U1'

preferredTypes = [<class 'int'>]

decode (data, start=0)

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data, text_pos=0*)
 Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode ()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header (*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (*dataformat*)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get ()

Return the internal value.

Returns internal value

Return type list/integer/float

static get_format (*dataformat, showname=False*)

Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (*value*)

Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value (*value*)

Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

class secsgem.secs.variables.**SecsVarU2** (*value=None, count=-1*)

Bases: *secsgem.secs.variables.SecsVarNumber*

Secs type for 2 byte unsigned data.

Parameters

- **value** (*list/integer*) – initial value
- **count** (*integer*) – number of items this value

formatCode = 42

textCode = 'U2'

preferredTypes = [<class 'int'>]

decode (*data, start=0*)

Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data, text_pos=0*)

Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode ()

Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header (*length*)

Encode item header depending on the number of length bytes required.

Parameters **length** (*integer*) – number of bytes in data

Returns encoded item header bytes

Return type string

static generate (*dataformat*)

Generate actual variable from data format.

Parameters **dataformat** (*list/SecsVar based class*) – dataformat to create variable for

Returns created variable

Return type SecsVar based class

get ()

Return the internal value.

Returns internal value

Return type list/integer/float

static get_format (*dataformat*, *showname=False*)
 Gets the format of the function.

Returns returns the string representation of the function

Return type string

set (*value*)
 Set the internal value to the provided value.

Parameters **value** (*list/integer/float*) – new value

supports_value (*value*)
 Check if the current instance supports the provided value.

Parameters **value** (*any*) – value to test

class secsgem.secs.variables.SecsVarU4 (*value=None*, *count=-1*)
 Bases: *secsgem.secs.variables.SecsVarNumber*

Secs type for 4 byte unsigned data.

Parameters

- **value** (*list/integer*) – initial value
- **count** (*integer*) – number of items this value

formatCode = 44

textCode = 'U4'

decode (*data*, *start=0*)
 Decode the secs byte data to the value.

Parameters

- **data** (*string*) – encoded data bytes
- **start** (*integer*) – start position of value the data

Returns new start position

Return type integer

decode_item_header (*data*, *text_pos=0*)
 Encode item header depending on the number of length bytes required.

Parameters

- **data** (*string*) – encoded data
- **text_pos** (*integer*) – start of item header in data

Returns start position for next item, format code, length item of data

Return type (integer, integer, integer)

encode()
 Encode the value to secs data.

Returns encoded data bytes

Return type string

encode_item_header (*length*)
 Encode item header depending on the number of length bytes required.

Parameters `length` (*integer*) – number of bytes in data
Returns encoded item header bytes
Return type string

static generate (*dataformat*)
Generate actual variable from data format.

Parameters `dataformat` (*list/SecsVar based class*) – dataformat to create variable for
Returns created variable
Return type SecsVar based class

get()
Return the internal value.
Returns internal value
Return type list/integer/float

static get_format (*dataformat, showname=False*)
Gets the format of the function.
Returns returns the string representation of the function
Return type string

set (*value*)
Set the internal value to the provided value.
Parameters `value` (*list/integer/float*) – new value

supports_value (*value*)
Check if the current instance supports the provided value.
Parameters `value` (*any*) – value to test

preferredTypes = [`<class 'int'>`]

3.6.2.2 Data Items

Data items for functions.

class secsgem.secs.dataitems.**DataItemMeta**
Bases: type

Meta class for data items.

class secsgem.secs.dataitems.**DataItemBase** (*value=None*)
Bases: object

Base class for data items.

It provides type and output handling.

classmethod **get_format** (*showname=True*)
Format the contents as a string.

Parameters `showname` – Display the real class name when True

Returns Formatted value string

class secsgem.secs.dataitems.**ACKC5** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarBinary

Acknowledge code.

Types SecsVarBinary

Length 1

Values

Value	Description	Constant
0	Accepted	secsgem.secs.dataitems.ACKC5.ACCEPTED
1-63	Error	secsgem.secs.dataitems.ACKC5.ERROR

Used In Function

- SecsS05F02
- SecsS05F04

ACCEPTED = 0

ERROR = 1

class secsgem.secs.dataitems.**ACKC6** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarBinary

Acknowledge code.

Types SecsVarBinary

Length 1

Values

Value	Description	Constant
0	Accepted	secsgem.secs.dataitems.ACKC6.ACCEPTED
1-63	Error	secsgem.secs.dataitems.ACKC6.ERROR

Used In Function

- SecsS06F02
- SecsS06F04
- SecsS06F10
- SecsS06F12
- SecsS06F14

ACCEPTED = 0

ERROR = 1

class secsgem.secs.dataitems.**ACKC7** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarBinary

Acknowledge code.

Types *SecsVarBinary*

Length 1

Values

Value	Description	Constant
0	Accepted	<i>secsgem.secs.dataitems.ACKC7.ACCEPTED</i>
1	Permission not granted	<i>secsgem.secs.dataitems.ACKC7.NO_PERMISSION</i>
2	Length error	<i>secsgem.secs.dataitems.ACKC7.LENGTH_ERROR</i>
3	Matrix overflow	<i>secsgem.secs.dataitems.ACKC7.MATRIX_OVERFLOW</i>
4	PPID not found	<i>secsgem.secs.dataitems.ACKC7.PPID_NOT_FOUND</i>
5	Mode unsupported	<i>secsgem.secs.dataitems.ACKC7.MODE_UNSUPPORTED</i>
6	Performed later	<i>secsgem.secs.dataitems.ACKC7.PERFORMED_LATER</i>
7-63	Reserved	

Used In Function

Used In Function

- *SecsS02F30*

class secsgem.secs.dataitems.**ECNAME** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.
SecsVarString

Equipment constant name.

Types

- *SecsVarString*

Used In Function

- *SecsS02F30*

class secsgem.secs.dataitems.**ECV** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.
SecsVarDynamic

Equipment constant value.

Types

- *SecsVarBinary*
- *SecsVarBoolean*
- *SecsVarString*
- *SecsVarI8*
- *SecsVarI1*
- *SecsVarI2*

Used In Function

- *SecsS09F13*

class secsgem.secs.dataitems.**ERACK** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarBinary

Enable/disable event report acknowledge.

Types *SecsVarBinary*

Length 1

Values

Value	Description	Constant
0	Accepted	<i>secsgem.secs.dataitems.ERACK.ACCEPTED</i>
1	Denied, CEID doesn't exist	<i>secsgem.secs.dataitems.ERACK.CEID_UNKNOWN</i>
2-63	Reserved	

Used In Function

- *SecsS02F38*

ACCEPTED = 0

CEID_UNKNOWN = 1

class secsgem.secs.dataitems.**ERRCODE** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarDynamic

Reference point.

class secsgem.secs.dataitems.**EXMESSAGE** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.
SecsVarString

Exception message.

Types

- *SecsVarString*

Used In Function

- *SecsS05F09*
- *SecsS05F11*

class secsgem.secs.dataitems.**EXRECVRA** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarString

Exception recovery action.

Types

- *SecsVarString*

Used In Function

- *SecsS05F09*
- *SecsS05F13*

class secsgem.secs.dataitems.**EXTYPE** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarString

Exception type.

Types

- *SecsVarString*

Used In Function

- *SecsS05F09*
- *SecsS05F11*
- *SecsS14F01*
- *SecsS14F02*
- *SecsS14F08*

class secsgem.secs.dataitems.**FFROT** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarU2

Film frame rotation.

In degrees from the bottom CW. (Bottom equals zero degrees.) Zero length indicates not used.

Types *SecsVarU2*

Used In Function

- *SecsS12F01*
- *SecsS12F03*

class secsgem.secs.dataitems.**FNLOC** (*value=None*)
 Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarU2

Flat/notch location.

In degrees from the bottom CW. (Bottom equals zero degrees.) Zero length indicates not used.

Types *SecsVarU2*

Used In Function

- *SecsS12F01*
- *SecsS12F03*
- *SecsS12F04*

class secsgem.secs.dataitems.**GRANT6** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.
SecsVarBinary

Permission to send.

Types *SecsVarBinary*

Length 1

Values

Value	Description	Constant
0	Granted	<i>secsgem.secs.dataitems.GRANT6.GRANTED</i>
1	Busy	<i>secsgem.secs.dataitems.GRANT6.BUSY</i>
2	Not interested	<i>secsgem.secs.dataitems.GRANT6.NOT_INTERESTED</i>
3-63	Other error	

Used In Function

- *SecsS06F06*

GRANTED = 0

BUSY = 1

NOT_INTERESTED = 2

class secsgem.secs.dataitems.**GRNT1** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.
SecsVarBinary

Grant code.

Types *SecsVarBinary*

Length 1

Values

Value	Description	Constant
0	Acknowledge	<code>secsgem.secs.dataitems.GRNT1.ACK</code>
1	Busy, try again	<code>secsgem.secs.dataitems.GRNT1.BUSY</code>
2	No space	<code>secsgem.secs.dataitems.GRNT1.NO_SPACE</code>
3	Map too large	<code>secsgem.secs.dataitems.GRNT1.MAP_TOO_LARGE</code>
4	Duplicate ID	<code>secsgem.secs.dataitems.GRNT1.DUPLICATE_ID</code>
5	Material ID not found	<code>secsgem.secs.dataitems.GRNT1.MATERIALID_UNKNOWN</code>
6	Unknown map format	<code>secsgem.secs.dataitems.GRNT1.UNKNOWN_MAP_FORMAT</code>
7-63	Reserved, error	

Used In Function

- `SecsS12F06`

```
ACK = 0
BUSY = 1
NO_SPACE = 2

- *SecsS06F22*
- *SecsS17F01*

class secsgem.secs.dataitems.**XDIES** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.SecsVarDynamic

Die size/index X-axis.

Types

- *SecsVarF4*
- *SecsVarF8*

- *SecsVarU8*
- *SecsVarU1*
- *SecsVarU2*
- *SecsVarU4*

Used In Function

- *SecsS12F01*
- *SecsS12F04*

class secsgem.secs.dataitems.**XPOS** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.
SecsVarDynamic

X/Y coordinate position.

Types

- *SecsVarI8*
- *SecsVarI1*
- *SecsVarI2*
- *SecsVarI4*

Used In Function

- *SecsS12F11*
- *SecsS12F18*

class secsgem.secs.dataitems.**YDIES** (*value=None*)
Bases: secsgem.secs.dataitems.DataItemBase, secsgem.secs.variables.
SecsVarDynamic

Die size/index Y-axis.

Types

- *SecsVarF4*
- *SecsVarF8*
- *SecsVarU8*
- *SecsVarU1*
- *SecsVarU2*
- *SecsVarU4*

Used In Function

- *SecsS12F01*
- *SecsS12F04*

3.6.2.3 FunctionBase

Base class for for SECS stream and functions.

class secsgem.secs.functionbase.**StructureDisplayingMeta**
Bases: type

Meta class overriding the default `__repr__` of a class.

mro()
Return a type's method resolution order.

class secsgem.secs.functionbase.**SecsStreamFunction** (*value=None*)
Bases: object

Secs stream and function base class.

This class is inherited to create a stream/function class. To create a function specific content the class variables `_stream`, `_function` and `_dataFormat` must be overridden.

append (*data*)
Append data to list, if stream/function parameter is a list.

Parameters **data** (*various*) – list item to add

encode ()
Generates the encoded hsms data of the stream/function parameter.

Returns encoded data

Return type string

decode (*data*)
Updates stream/function parameter data from the passed data.

Parameters **data** (*string*) – encoded data

set (*value*)
Updates the value of the stream/function parameter.

Parameters **value** (*various*) – new value for the parameter

get ()
Gets the current value of the stream/function parameter.

Returns current parameter value

Return type various

classmethod **get_format** ()
Gets the format of the function.

Returns returns the string representation of the function

Return type string

3.6.2.4 Functions

Wrappers for SECS stream and functions.

class secsgem.secs.functions.**SecsS00F00** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*

Hsms communication.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS00F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS00F00()
S0F0 .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS01F00** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
abort transaction stream 1.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F00()
S1F0 .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS01F01** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
are you online - request.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F01
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F01()
S1F1 W .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS01F02** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
on line data.

Caution: This Stream/function has different structures depending on the source. If it is sent from the equipment side it has the structure below, if it is sent from the host it is an empty list. Be sure to fill the array accordingly.

Structure E->H:

```
{  
    MDLN: A[20]  
    SOFTREV: A[20]  
}
```

Example:

```
>>> import secsgem  
>>> secsgem.SecsS01F02(['secsgem', '0.0.6']) # E->H  
S1F2  
<L [2]  
  <A "secsgem">  
  <A "0.0.6">  
> .  
>>> secsgem.SecsS01F02() #H->E  
S1F2  
<L> .
```

Parameters value (list) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS01F03** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*

Selected equipment status - request.

Data Items

- *SVID*

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS01F03  
[  
    SVID: U1/U2/U4/U8/I1/I2/I4/I8/A  
    ...  
]
```

Example:

```
>>> import secsgem  
>>> secsgem.SecsS01F03([1, "1337", 12])  
S1F3 W  
<L [3]  
  <U1 1 >  
  <A "1337">  
  <U1 12 >  
> .
```

Parameters value (list) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS01F04** (*value=None*)
Bases: secsgem.secs.functionbase.SecsStreamFunction
 selected equipment status - data.

Data Items

- *SV*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F04
[
    SV: L/BOOLEAN/U1/U2/U4/U8/I1/I2/I4/I8/F4/F8/A/B
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F04([secsgem.SecsVarU1(1), "text", secsgem.SecsVarU4(1337)])
S1F4
<L [3]
  <U1 1 >
  <A "text">
  <U4 1337 >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS01F11** (*value=None*)
Bases: secsgem.secs.functionbase.SecsStreamFunction
 status variable namelist - request.

Data Items

- *SVID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F11
[
    SVID: U1/U2/U4/U8/I1/I2/I4/I8/A
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F11([1, 1337])
S1F11 W
<L [2]
  <U1 1 >
  <U2 1337 >
> .
```

An empty list will return all available status variables.

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS01F12(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
status variable namelist - reply.
```

Data Items

- *SVID*
- *SVNAME*
- *UNITS*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F12
[
{
    SVID: U1/U2/U4/U8/I1/I2/I4/I8/A
    SVNAME: A
    UNITS: A
}
...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F12([{"SVID": 1, "SVNAME": "SV1", "UNITS": "mm"}, ...
... {"SVID": 1337, "SVNAME": "SV2", "UNITS": ""}])
S1F12
<L [2]
  <L [3]
    <U1 1 >
    <A "SV1">
    <A "mm">
  >
  <L [3]
    <U2 1337 >
    <A "SV2">
    <A>
  >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS01F13(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
establish communication - request.
```

Caution: This Stream/function has different structures depending on the source. If it is sent from the equipment side it has the structure below, if it is sent from the host it is an empty list. Be sure to fill the array accordingly.

Structure E->H:

```
{
    MDLN: A[20]
    SOFTREV: A[20]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F13(['secsgem', '0.0.6']) # E->H
S1F13 W
<L [2]
<A "secsgem">
<A "0.0.6">
> .
>>> secsgem.SecsS01F13() #H->E
S1F13 W
<L> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS01F14** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
establish communication - acknowledge.

Caution: This Stream/function has different structures depending on the source. See structure definition below for details. Be sure to fill the array accordingly.

Data Items

- *COMMACK*

Structure E->H:

```
{
    COMMACK: B[1]
    DATA: [
        MDLN: A[20]
        SOFTREV: A[20]
    ]
}
```

Structure H->E:

```
{
    COMMACK: B[1]
    DATA: []
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F14({"COMMACK": secsgem.COMMACK.ACCEPTED, "MDLN": ["secsgem",
    "0.0.6"]})
S1F14
```

(continues on next page)

(continued from previous page)

```
<L [2]
  <B 0x0>
  <L [2]
    <A "secsgem">
    <A "0.0.6">
  >
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS01F15** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*

request offline.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F15
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F15()
S1F15 W .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS01F16** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
offline acknowledge.

Data Items

- *OFLACK*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F16
OFLACK: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F16(secsgem.OFLACK.ACK)
S1F16
<B 0x0> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS01F17** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
request online.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F17
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F17()
S1F17 W .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS01F18** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
online acknowledge.

Data Items

- *ONLACK*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS01F18
ONLACK: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS01F18(secsgem.ONLACK.ALREADY_ON)
S1F18
<B 0x2> .
```

Parameters value (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F00** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
abort transaction stream 2.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F00()
S2F0 .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS02F13**(*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
equipment constant - request.

Data Items

- *ECID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F13
[
    ECID: U1/U2/U4/U8/I1/I2/I4/I8/A
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F13([1, 1337])
S2F13 W
<L [2]
  <U1 1 >
  <U2 1337 >
> .
```

An empty list will return all available equipment constants.

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F14**(*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
equipment constant - data.

Data Items

- *ECV*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F14
[
    ECV: L/BOOLEAN/I8/I1/I2/I4/F8/F4/U8/U1/U2/U4/A/B
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F14([secsgem.SecsVarU1(1), "text"])
S2F14
<L [2]
  <U1 1 >
  <A "text">
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F15** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
new equipment constant - send.

Data Items

- *ECID*
- *ECV*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F15
[
{
    ECID: U1/U2/U4/U8/I1/I2/I4/I8/A
    ECV: L/BOOLEAN/I8/I1/I2/I4/F8/F4/U8/U1/U2/U4/A/B
}
...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F15([{"ECID": 1, "ECV": secsgem.SecsVarU4(10)}, {"ECID": "1337"
↪", "ECV": "text"}])
S2F15 W
<L [2]
<L [2]
    <U1 1 >
    <U4 10 >
>
<L [2]
    <A "1337">
    <A "text">
>
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F16** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
new equipment constant - acknowledge.

Data Items

- *EAC*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F16
EAC: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F16(secsgem.EAC.BUSY)
S2F16
<B 0x2> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F17** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
date and time - request.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F17
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F17()
S2F17 W .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS02F18** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
date and time - data.

Data Items

- *TIME*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F18
TIME: A[32]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F18("160816205942")
S2F18
<A "160816205942"> .
```

Parameters **value** (*ASCII string*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F29** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
equipment constant namelist - request.

Data Items

- *ECID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F29
[
    ECID: U1/U2/U4/U8/I1/I2/I4/I8/A
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F29([1, 1337])
S2F29 W
<L [2]
<U1 1 >
<U2 1337 >
> .
```

An empty list will return all available equipment constants.

Parameters `value (list)` – parameters for this function (see example)

class `secsgem.secs.functions.SecsS02F30 (value=None)`
Bases: `secsgem.secs.functionbase.SecsStreamFunction`
equipment constant namelist.

Data Items

- `ECID`
- `ECNAME`
- `ECMIN`
- `ECMAX`
- `ECDEF`
- `UNITS`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F30
[
    {
        ECID: U1/U2/U4/U8/I1/I2/I4/I8/A
        ECNAME: A
        ECMIN: BOOLEAN/I8/I1/I2/I4/F8/F4/U8/U1/U2/U4/A/B
        ECMAX: BOOLEAN/I8/I1/I2/I4/F8/F4/U8/U1/U2/U4/A/B
        ECDEF: BOOLEAN/I8/I1/I2/I4/F8/F4/U8/U1/U2/U4/A/B
        UNITS: A
    }
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS0F30([
    {"ECID": 1, "ECNAME": "EC1", "ECMIN": 0,
     "ECMAX": secsgem.SecsVarU1(100), "ECDEF": 100},
    {"ECID": 1337, "ECNAME": "EC2",
     "ECMIN": "", "ECMAX": "", "ECDEF": "", "UNITS": ""}])
S2F30
<L [2]
<L [6]
<U1 1 >
<A "EC1">
<U1 0 >
<U1 100 >
<U1 50 >
<A "mm">
>
<L [6]
<U2 1337 >
<A "EC2">
<A>
<A>
<A>
<A>
>
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS02F33(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
define report.
```

Data Items

- *DATAID*
- *RPTID*
- *VID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F33
{
    DATAID: U1/U2/U4/U8/I1/I2/I4/I8/A
    DATA: [
        {
            RPTID: U1/U2/U4/U8/I1/I2/I4/I8/A
            VID: [
                DATA: U1/U2/U4/U8/I1/I2/I4/I8/A
                ...
            ]
            ...
        }
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F33({"DATAID": 1, "DATA": [{"RPTID": 1000, "VID": [12, 1337]}, {"RPTID": 1001, "VID": [1, 2355]}]})
S2F33 W
<L [2]
  <U1 1 >
  <L [2]
    <L [2]
      <U2 1000 >
      <L [2]
        <U1 12 >
        <U2 1337 >
      >
    >
    <L [2]
      <U2 1001 >
      <L [2]
        <U1 1 >
        <U2 2355 >
      >
    >
  >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F34** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
define report - acknowledge.

Data Items

- *DRACK*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F34
DRACK: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F34(secsgem.DRACK.INVALID_FORMAT)
S2F34
<B 0x2> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F35** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
link event report.

Data Items

- *DATAID*

- *CEID*
- *RPTID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F35
{
    DATAID: U1/U2/U4/U8/I1/I2/I4/I8/A
    DATA: [
        {
            CEID: U1/U2/U4/U8/I1/I2/I4/I8/A
            RPTID: [
                DATA: U1/U2/U4/U8/I1/I2/I4/I8/A
                ...
            ]
        }
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F35({"DATAID": 1, "DATA": [{"CEID": 1337, "RPTID": [1000, ↵1001]}]})
```

S2F35 W
<L [2]
 <U1 1 >
 <L [1]
 <L [2]
 <U2 1337 >
 <L [2]
 <U2 1000 >
 <U2 1001 >
 >
 >
> .

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F36** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
link event report - acknowledge.

Data Items

- *LRACK*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F36
LRACK: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F36(secsgem.LRACK.CEID_UNKNOWN)
S2F36
<B 0x4> .
```

Parameters `value` (`byte`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS02F37` (`value=None`)
 Bases: `secsgem.secs.functionbase.SecsStreamFunction`
 en-/disable event report.

Data Items

- `CEED`
- `CEID`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F37
{
    CEEP: BOOLEAN[1]
    CEID: [
        DATA: U1/U2/U4/U8/I1/I2/I4/I8/A
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F37({"CEED": True, "CEID": [1337] })
S2F37 W
<L [2]
<BOOLEAN True >
<L [1]
<U2 1337 >
>
> .
```

Parameters `value` (`list`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS02F38` (`value=None`)
 Bases: `secsgem.secs.functionbase.SecsStreamFunction`
 en-/disable event report - acknowledge.

Data Items

- `ERACK`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F38
ERACK: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecssS02F38(secsgem.ERACK.CEID_UNKNOWN)
S2F38
<B 0x1> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F41** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
host command - send.

Data Items

- *RCMD*
- *CPNAME*
- *CPVAL*

Structure:

```
>>> import secsgem
>>> secsgem.SecssS02F41
{
    RCMD: U1/I1/A
    PARAMS: [
        {
            CPNAME: U1/U2/U4/U8/I1/I2/I4/I8/A
            CPVAL: BOOLEAN/U1/U2/U4/U8/I1/I2/I4/I8/A/B
        }
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecssS02F41({ "RCMD": "COMMAND", "PARAMS": [ { "CPNAME": "PARAM1", "CPVAL": "VAL1" }, { "CPNAME": "PARAM2", "CPVAL": "VAL2" } ] })
S2F41 W
<L [2]
  <A "COMMAND">
  <L [2]
    <L [2]
      <A "PARAM1">
      <A "VAL1">
    >
    <L [2]
      <A "PARAM2">
      <A "VAL2">
    >
  >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS02F42** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*

host command - acknowledge.

Data Items

- *HCACK*
- *CPNAME*
- *CPACK*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS02F42
{
    HCACK: B[1]
    PARAMS: [
        {
            CPNAME: U1/U2/U4/U8/I1/I2/I4/I8/A
            CPACK: B[1]
        }
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS02F42({
    <-- "PARAMS": [
    <--CPVAL_ILLEGAL_VALUE},
    <--CPACK.CPVAL_ILLEGAL_FORMAT}])
S2F42
<L [2]
<B 0x1>
<L [2]
<L [2]
    <A "PARAM1">
    <B 0x2>
    >
    <L [2]
        <A "PARAM2">
        <B 0x3>
    >
    >
    > .
    .
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS05F00 (value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
abort transaction stream 5.
```

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F00()
S5F0 .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS05F01** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
alarm report - send.

Data Items

- *ALCD*
- *ALID*
- *ALTX*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F01
{
    ALCD: B[1]
    ALID: U1/U2/U4/U8/I1/I2/I4/I8
    ALTX: A[120]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F01({"ALCD": secsgem.ALCD.PERSONAL_SAFETY | secsgem.ALCD.ALARM_
    ↵SET, "ALID": 100, "ALTX": "text"})
S5F1
<L [3]
  <B 0x81>
  <U1 100 >
  <A "text">
> .
```

Parameters value (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS05F02** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
alarm report - acknowledge.

Data Items

- *ACKC5*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F02
ACKC5: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F02(secsgem.ACCKC5.ACCEPTED)
S5F2
<B 0x0> .
```

Parameters `value` (`byte`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS05F03` (`value=None`)
 Bases: `secsgem.secs.functionbase.SecsStreamFunction`
 en-/disable alarm - send.

Data Items

- `ALED`
- `ALID`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F03
{
    ALED: B[1]
    ALID: U1/U2/U4/U8/I1/I2/I4/I8
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F03({"ALED": secsgem.ALED.ENABLE, "ALID": 100})
S5F3
<L [2]
  <B 0x80>
  <U1 100 >
> .
```

Parameters `value` (`list`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS05F04` (`value=None`)
 Bases: `secsgem.secs.functionbase.SecsStreamFunction`
 en-/disable alarm - acknowledge.

Data Items

- `ACKC5`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F04
ACKC5: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F04(secsgem.ACCKC5.ACCEPTED)
```

(continues on next page)

(continued from previous page)

```
S5F4  
<B 0x0> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS05F05(value=None)  
Bases: secsgem.secs.functionbase.SecsStreamFunction  
list alarms - request.
```

Data Items

- *ALID*

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS05F05  
[  
    ALID: U1/U2/U4/U8/I1/I2/I4/I8  
    ...  
]
```

Example:

```
>>> import secsgem  
>>> secsgem.SecsS05F05([100, 200])  
S5F5 W  
<L [2]  
<U1 100 >  
<U1 200 >  
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS05F06(value=None)  
Bases: secsgem.secs.functionbase.SecsStreamFunction  
list alarms - data.
```

Data Items

- *ALCD*
- *ALID*
- *ALTX*

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS05F06  
[  
    {  
        ALCD: B[1]  
        ALID: U1/U2/U4/U8/I1/I2/I4/I8  
        ALTX: A[120]  
    }  
]
```

(continues on next page)

(continued from previous page)

```
...  
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F06([{"ALCD": secsgem.ALCD.PERSONAL_SAFETY | secsgem.ALCD.
    ↵ALARM_SET, "ALID": 100, "ALTX": "text"}])
S5F6
  <L [1]
    <L [3]
      <B 0x81>
      <U1 100 >
      <A "text">
    >
  > .
```

Parameters value (list) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS05F07** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 list enabled alarms - request.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F07
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F07()
S5F7 W .
```

Parameters value (list) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS05F08** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 list enabled alarms - data.

Data Items

- *ALCD*
- *ALID*
- *ALTX*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F08
[
  {
    ALCD: B[1]
```

(continues on next page)

(continued from previous page)

```
    ALID: U1/U2/U4/U8/I1/I2/I4/I8
    ALTX: A[120]
}
...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F08([{"ALCD": secsgem.ALCD.PERSONAL_SAFETY | secsgem.ALCD.
->ALARM_SET, "ALID": 100, "ALTX": "text"}])
S5F8
<L [1]
<L [3]
<B 0x81>
<U1 100 >
<A "text">
>
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS05F09** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
exception post - notify.

Data Items

- *TIMESTAMP*
- *EXID*
- *EXTYPE*
- *EXMESSAGE*
- *EXRECVRA*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F09
{
    TIMESTAMP: A[32]
    EXID: A[20]
    EXTTYPE: A
    EXMESSAGE: A
    EXRECVRA: [
        DATA: A[40]
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F09({
        "TIMESTAMP": "161006221500",
        "EXID": "EX123",
        "EXTYPE": "ALARM",
        "EXMESSAGE": "Exception",
        "EXRECVRA": ["EXRECVRA1", "EXRECVRA2"] })
(continues on next page)
```

(continued from previous page)

```
S5F9
<L [5]
  <A "161006221500">

> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS05F10** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 exception post - confirm.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F10
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F10()
S5F10 .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS05F11** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 exception clear - notify.

Data Items

- *TIMESTAMP*
- *EXID*
- *EXTYPE*
- *EXMESSAGE*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F11
{
    TIMESTAMP: A[32]
    EXID: A[20]
    EXTYPEn: A
    EXMESSAGE: A
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F11({"TIMESTAMP": "161006221500", "EXID": "EX123", "EXTYPE": 
    ↪"ALARM", "EXMESSAGE": "Exception"})
S5F11
<L [4]
<A "161006221500">
<A "EX123">
<A "ALARM">
<A "Exception">
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS05F12** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
exception clear - confirm.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F12
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F12()
S5F12 .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS05F13** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
exception recover - request.

Data Items

- *EXID*
- *EXRECVRA*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F13
{
    EXID: A[20]
    EXRECVRA: A[40]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F13({"EXID": "EX123", "EXRECVRA": "EXRECVRA2"})
S5F13 W
```

(continues on next page)

(continued from previous page)

```
<L [2]
  <A "EX123">
  <A "EXRECVRA2">
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS05F14(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
exception recover - acknowledge.
```

Data Items

- *EXID*
- *ACKA*
- *ERRCODE*
- *ERRTEXT*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F14
{
    EXID: A[20]
    DATA: {
        ACKA: BOOLEAN[1]
        DATA: {
            ERRCODE: I1/I2/I4/I8
            ERRTEXT: A[120]
        }
    }
}
```

Example::

```
>>> import secsgem
>>> secsgem.SecsS05F14({"EXID": "EX123", "DATA": {"ACKA": False, "DATA": {
    ↪"ERRCODE": 10, "ERRTEXT": "Error"}}})
S5F14
<L [2]
  <A "EX123">
  <L [2]
    <BOOLEAN False >
    <L [2]
      <I1 10 >
      <A "Error">
    >
  >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS05F15(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
```

exception recover complete - notify.

Data Items

- *TIMESTAMP*
- *EXID*
- *ACKA*
- *ERRCODE*
- *ERRTEXT*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F15
{
    TIMESTAMP: A[32]
    EXID: A[20]
    DATA: {
        ACKA: BOOLEAN[1]
        DATA: {
            ERRCODE: I1/I2/I4/I8
            ERRTEXT: A[120]
        }
    }
}
```

Example::

```
>>> import secsgem
>>> secsgem.SecsS05F15({ "TIMESTAMP": "161006221500", "EXID": "EX123", "DATA": {
    "ACKA": False, "DATA": { "ERRCODE": 10, "ERRTEXT": "Error" } } })
S5F15
<L [3]
  <A "161006221500">
  <A "EX123">
  <L [2]
    <BOOLEAN False >
    <L [2]
      <I1 10 >
      <A "Error">
    >
  >
>
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS05F16(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
exception recover complete - confirm.
```

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F16
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F16()
S5F16 .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS05F17** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
exception recover abort - request.

Data Items

- *EXID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F17
EXID: A[20]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS05F17("EX123")
S5F17 W
<A "EX123">< .
```

Parameters value (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS05F18** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
exception recover abort - acknowledge.

Data Items

- *EXID*
- *ACKA*
- *ERRCODE*
- *ERRTEXT*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS05F18
{
    EXID: A[20]
    DATA: {
        ACKA: BOOLEAN[1]
        DATA: {
            ERRCODE: I1/I2/I4/I8
            ERRTEXT: A[120]
        }
    }
}
```

Example::

```
>>> import secsgem
>>> secsgem.SecsS05F18({ "EXID": "EX123", "DATA": { "ACKA": False, "DATA": { 
    ↪"ERRCODE": 10, "ERRTEXT": "Error" } } })
S5F18
<L [2]
  <A "EX123">
  <L [2]
    <BOOLEAN False >
    <L [2]
      <I1 10 >
      <A "Error">
    >
  >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS06F00** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
abort transaction stream 6.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F00()
S6F0 .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS06F05** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
multi block data inquiry.

Data Items

- *DATAID*
- *DATALENGTH*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F05
{
  DATAID: U1/U2/U4/U8/I1/I2/I4/I8/A
  DATALENGTH: U1/U2/U4/U8/I1/I2/I4/I8
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F05({"DATAID": 1, "DATALENGTH": 1337})
S6F5 W
<L [2]
<U1 1 >
<U2 1337 >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS06F06** (*value=None*)

Bases: *secsgem.secs.functionbase.SecsStreamFunction*

multi block data grant.

Data Items

- *GRANT6*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F06
GRANT6: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F06(secsgem.GRANT6.BUSY)
S6F6
<B 0x1> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS06F07** (*value=None*)

Bases: *secsgem.secs.functionbase.SecsStreamFunction*

data transfer request.

Data Items

- *DATAID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F07
DATAID: U1/U2/U4/U8/I1/I2/I4/I8/A
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F07(1)
S6F7 W
<U1 1 > .
```

Parameters **value** (*integer*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS06F08(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction

data transfer data.
```

Data Items

- *DATAID*
- *CEID*
- *DSID*
- *DVNAME*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F08
{
    DATAID: U1/U2/U4/U8/I1/I2/I4/I8/A
    CEID: U1/U2/U4/U8/I1/I2/I4/I8/A
    DS: [
        {
            DSID: U1/U2/U4/U8/I1/I2/I4/I8/A
            DV: [
                {
                    DVNAME: U1/U2/U4/U8/I1/I2/I4/I8/A
                    DVVAL: L/BOOLEAN/U1/U2/U4/U8/I1/I2/I4/I8/F4/F8/A/B
                }
            ...
        }
    ...
]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F08({
    "DATAID": 1,
    "CEID": 1337,
    "DS": [
        {
            "DSID": 1000,
            "DV": [
                {
                    "DVNAME": "VAR1",
                    "DVVAL": "VAR"
                },
                {
                    "DVNAME": "VAR2",
                    "DVVAL": secsgem.SecsVarU4(100)
                }
            ]
        }
    ]
})
```

(continues on next page)

(continued from previous page)

```
>
>
>
> .
```

Parameters `value` (`dict`) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS06F11(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction
event report.
```

Data Items

- `DATAID`
- `CEID`
- `RPTID`
- `V`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F11
{
    DATAID: U1/U2/U4/U8/I1/I2/I4/I8/A
    CEID: U1/U2/U4/U8/I1/I2/I4/I8/A
    RPT: [
        {
            RPTID: U1/U2/U4/U8/I1/I2/I4/I8/A
            V: [
                DATA: L/BOOLEAN/U1/U2/U4/U8/I1/I2/I4/I8/F4/F8/A/B
                ...
            ]
        }
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F11({"DATAID": 1, "CEID": 1337, "RPT": [{"RPTID": 1000, "V": [
    "VAR", secsgem.SecsVarU4(100)]}]})
S6F11 W
<L [3]
<U1 1 >
<U2 1337 >
<L [1]

```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS06F12(value=None)  
Bases: secsgem.secs.functionbase.SecsStreamFunction  
event report - acknowledge.
```

Data Items

- *ACKC6*

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS06F12  
ACKC6: B[1]
```

Example:

```
>>> import secsgem  
>>> secsgem.SecsS06F12(secsgem.ACKC6.ACCEPTED)  
S6F12  
<B 0x0> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS06F15(value=None)  
Bases: secsgem.secs.functionbase.SecsStreamFunction  
event report request.
```

Data Items

- *CEID*

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS06F15  
CEID: U1/U2/U4/U8/I1/I2/I4/I8/A
```

Example:

```
>>> import secsgem  
>>> secsgem.SecsS06F15(1337)  
S6F15 W  
<U2 1337 > .
```

Parameters **value** (*list*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS06F16(value=None)  
Bases: secsgem.secs.functionbase.SecsStreamFunction  
event report data.
```

Data Items

- *DATAID*
- *CEID*
- *RPTID*
- *V*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F16
{
    DATAID: U1/U2/U4/U8/I1/I2/I4/I8/A
    CEID: U1/U2/U4/U8/I1/I2/I4/I8/A
    RPT: [
        {
            RPTID: U1/U2/U4/U8/I1/I2/I4/I8/A
            V: [
                DATA: L/BOOLEAN/U1/U2/U4/U8/I1/I2/I4/I8/F4/F8/A/B
                ...
            ]
        }
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F16({"DATAID": 1, "CEID": 1337, "RPT": [{"RPTID": 1000, "V": [
    "VAR", secsgem.SecsVarU4(100)]}]}))
S6F16
<L [3]
  <U1 1 >
  <U2 1337 >
  <L [1]
    <L [2]
      <U2 1000 >
      <L [2]
        <A "VAR">
        <U4 100 >
      >
    >
  >
>
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS06F19** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
individual report request.

Data Items

- *RPTID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F19
RPTID: U1/U2/U4/U8/I1/I2/I4/I8/A
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F19(secsgem.SecsVarU4(1337))
S6F19 W
<U4 1337 > .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS06F20** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
individual report data.

Data Items

- *V*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F20
[
    V: L/BOOLEAN/U1/U2/U4/U8/I1/I2/I4/I8/F4/F8/A/B
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F20(["ASD", 1337])
S6F20
<L [2]
    <A "ASD">
    <U2 1337 >
> .
```

Parameters **value** (*list*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS06F21** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
annotated individual report request.

Data Items

- *RPTID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F21
RPTID: U1/U2/U4/U8/I1/I2/I4/I8/A
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F21(secsgem.SecsVarU4(1337))
S6F21 W
<U4 1337 > .
```

Parameters `value` (*list*) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS06F22` (`value=None`)
Bases: `secsgem.secs.functionbase.SecsStreamFunction`
annotated individual report data.

Data Items

- `VID`
- `V`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS06F22
[
{
    VID: U1/U2/U4/U8/I1/I2/I4/I8/A
    V: L/BOOLEAN/U1/U2/U4/U8/I1/I2/I4/I8/F4/F8/A/B
}
...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS06F22([{"VID": "VID1", "V": "ASD"}, {"VID": 2, "V": 1337}])
S6F22
<L [2]
<L [2]
    <A "VID1">
    <A "ASD">
>
<L [2]
    <U1 2 >
    <U2 1337 >
>
> .
```

Parameters `value` (*list*) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS07F00` (`value=None`)
Bases: `secsgem.secs.functionbase.SecsStreamFunction`
abort transaction stream 7.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS07F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS07F00()
S7F0 .
```

Parameters `value` (`None`) – function has no parameters

class `secsgem.secs.functions.SecsS07F01` (`value=None`)

Bases: `secsgem.secs.functionbase.SecsStreamFunction`

process program load - inquire.

Data Items

- `PPID`
- `LENGTH`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS07F01
{
    PPID: A/B[120]
    LENGTH: U1/U2/U4/U8/I1/I2/I4/I8
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS07F01({"PPID": "program", "LENGTH": 4})
S7F1 W
<L [2]
  <A "program">
  <U1 4 >
> .
```

Parameters `value` (`dict`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS07F02` (`value=None`)

Bases: `secsgem.secs.functionbase.SecsStreamFunction`

process program load - grant.

Data Items

- `PPGNT`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS07F02
PPGNT: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS07F02(secsgem.PPGNT.OK)
S7F2
<B 0x0> .
```

Parameters `value` (`byte`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS07F03` (`value=None`)
 Bases: `secsgem.secs.functionbase.SecsStreamFunction`
 process program - send.

Data Items

- `PPID`
- `PPBODY`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS07F03
{
    PPID: A/B[120]
    PPBODY: U1/U2/U4/U8/I1/I2/I4/I8/A/B
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS07F03({"PPID": "program", "PPBODY": secsgem.SecsVarBinary("data
  ↵") })
S7F3 W
<L [2]
  <A "program">
  <B 0x64 0x61 0x74 0x61>
> .
```

Parameters `value` (`dict`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS07F04` (`value=None`)
 Bases: `secsgem.secs.functionbase.SecsStreamFunction`
 process program - acknowledge.

Data Items

- `ACKC7`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS07F04
ACKC7: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecssS07F04(secsgem.ACKC7.MATRIX_OVERFLOW)
S7F4
<B 0x3> .
```

Parameters `value` (`byte`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS07F05` (`value=None`)
Bases: `secsgem.secs.functionbase.SecsStreamFunction`
process program - request.

Data Items

- `PPID`

Structure:

```
>>> import secsgem
>>> secsgem.SecssS07F05
PPID: A/B[120]
```

Example:

```
>>> import secsgem
>>> secsgem.SecssS07F05("program")
S7F5 W
<A "program"> .
```

Parameters `value` (`byte`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS07F06` (`value=None`)
Bases: `secsgem.secs.functionbase.SecsStreamFunction`
process program - data.

Data Items

- `PPID`
- `PPBODY`

Structure:

```
>>> import secsgem
>>> secsgem.SecssS07F06
{
    PPID: A/B[120]
    PPBODY: U1/U2/U4/U8/I1/I2/I4/I8/A/B
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecssS07F06({"PPID": "program", "PPBODY": secsgem.SecsVarBinary("data
    ↵") })
S7F6
<L [2]
<A "program">
```

(continues on next page)

(continued from previous page)

```
<B 0x64 0x61 0x74 0x61>
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS07F17(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction

delete process program - send.
```

Data Items

- *PPID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS07F17
[
    PPID: A/B[120]
    ...
]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS07F17(["program1", "program2"])
S7F17 W
<L [2]
    <A "program1">
    <A "program2">
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS07F18(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction

delete process program - acknowledge.
```

Data Items

- *ACKC7*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS07F18
ACKC7: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS07F18(secsgem.ACKC7.MODE_UNSUPPORTED)
S7F18
<B 0x5> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS07F19** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
current equipment process program - request.

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS07F19  
Header only
```

Example:

```
>>> import secsgem  
>>> secsgem.SecsS07F19()  
S7F19 W .
```

Parameters value (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS07F20** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
current equipment process program - data.

Data Items

- *PPID*

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS07F20  
[  
    PPID: A/B[120]  
    ...  
]
```

Example:

```
>>> import secsgem  
>>> secsgem.SecsS07F20(["program1", "program2"])  
S7F20  
<L [2]  
  <A "program1">  
  <A "program2">  
> .
```

Parameters value (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS09F00** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
abort transaction stream 9.

Structure:

```
>>> import secsgem  
>>> secsgem.SecsS09F00  
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F00()
S9F0 .
```

Parameters value (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS09F01** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
unrecognized device id.

Data Items

- *MHEAD*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS09F01
MHEAD: B[10]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F01("HEADERDATA")
S9F1
<B 0x48 0x45 0x41 0x44 0x45 0x52 0x44 0x41 0x54 0x41> .
```

Parameters value (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS09F03** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
unrecognized stream type.

Data Items

- *MHEAD*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS09F03
MHEAD: B[10]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F03("HEADERDATA")
S9F3
<B 0x48 0x45 0x41 0x44 0x45 0x52 0x44 0x41 0x54 0x41> .
```

Parameters value (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS09F05** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*

unrecognized function type.

Data Items

- *MHEAD*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS09F05
MHEAD: B[10]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F05("HEADERDATA")
S9F5
<B 0x48 0x45 0x41 0x44 0x45 0x52 0x44 0x41 0x54 0x41> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS09F07** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
illegal data.

Data Items

- *MHEAD*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS09F07
MHEAD: B[10]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F07("HEADERDATA")
S9F7
<B 0x48 0x45 0x41 0x44 0x45 0x52 0x44 0x41 0x54 0x41> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS09F09** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
transaction timer timeout.

Data Items

- *SHEAD*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS09F09
SHEAD: B[10]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F09("HEADERDATA")
S9F9
<B 0x48 0x45 0x41 0x44 0x45 0x52 0x44 0x41 0x54 0x41> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS09F11** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 data too long.

Data Items

- *MHEAD*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS09F11
MHEAD: B[10]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F11("HEADERDATA")
S9F11
<B 0x48 0x45 0x41 0x44 0x45 0x52 0x44 0x41 0x54 0x41> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS09F13** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 conversation timeout.

Data Items

- *MEXP*
- *EDID*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS09F13
{
    MEXP: A[6]
    EDID: U1/U2/U4/U8/I1/I2/I4/I8/A/B
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS09F13({"MEXP": "S01E01", "EDID": "data"})
S9F13
<L [2]
<A "S01E01">
```

(continues on next page)

(continued from previous page)

```
<A "data">
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS10F00** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
abort transaction stream 10.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS10F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS10F00()
S10F0 .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS10F01** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
terminal - request.

Data Items

- *TID*
- *TEXT*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS10F01
{
    TID: B[1]
    TEXT: U1/U2/U4/U8/I1/I2/I4/I8/A/B
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS10F01({"TID": 0, "TEXT": "hello?"})
S10F1
<L [2]
  <B 0x0>
  <A "hello?">
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS10F02** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
terminal - acknowledge.

Data Items

- *ACKC10*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS10F02
ACKC10: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS10F02(secsgem.ACKC10.ACCEPTED)
S10F2
<B 0x0> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS10F03** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
terminal single - display.

Data Items

- *TID*
- *TEXT*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS10F03
{
    TID: B[1]
    TEXT: U1/U2/U4/U8/I1/I2/I4/I8/A/B
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS10F03({"TID": 0, "TEXT": "hello!"})
S10F3
<L [2]
<B 0x0>
<A "hello!">
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS10F04** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
terminal single - acknowledge.

Data Items

- *ACKC10*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS10F04
ACKC10: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS10F04(secsgem.ACKC10.TERMINAL_NOT_AVAILABLE)
S10F4
<B 0x2> .
```

Parameters **value** (*byte*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS12F00** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
abort transaction stream 12.

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F00()
S12F0 .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS12F01** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*
map setup data - send.

Data Items

- *MID*
- *IDTYP*
- *FNLOC*
- *FFROT*
- *ORLOC*
- *RPSEL*
- *REFP*
- *DUTMS*
- *XDIES*

- *YDIES*
- *ROWCT*
- *COLCT*
- *NULBC*
- *PRDCT*
- *PRAXI*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F01
{
    MID: A/B[80]
    IDTYP: B[1]
    FNLOC: U2
    FFROT: U2
    ORLOC: B
    RPSEL: U1
    REFP: [
        DATA: I1/I2/I4/I8
        ...
    ]
    DUTMS: A
    XDIES: U1/U2/U4/U8/F4/F8
    YDIES: U1/U2/U4/U8/F4/F8
    ROWCT: U1/U2/U4/U8
    COLCT: U1/U2/U4/U8
    NULBC: U1/A
    PRDCT: U1/U2/U4/U8
    PRAXI: B[1]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F01({
    "MID": "materialID",
    "IDTYP": secsgem.IDTYP.WAFER,
    "FNLOC": 0,
    "FFROT": 0,
    "ORLOC": secsgem.ORLOC.UPPER_LEFT,
    "RPSEL": 0,

```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS12F12** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 map data type 3 - acknowledge.

Data Items

- *MDACK*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F12
MDACK: B[1]
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F12(secsgem.MDACK.FORMAT_ERROR)
S12F12
<B 0x1> .
```

Parameters `value` (`byte`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS12F13` (`value=None`)
Bases: `secsgem.secs.functionbase.SecsStreamFunction`
map data type 1 - request.

Data Items

- `MID`
- `IDTYP`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F13
{
    MID: A/B[80]
    IDTYP: B[1]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F13({"MID": "materialID", "IDTYP": secsgem.IDTYP.WAFER})
S12F13 W
<L [2]
    <A "materialID">
    <B 0x0>
> .
```

Parameters `value` (`dict`) – parameters for this function (see example)

class `secsgem.secs.functions.SecsS12F14` (`value=None`)
Bases: `secsgem.secs.functionbase.SecsStreamFunction`
map data type 1.

Data Items

- `MID`
- `IDTYP`
- `RSINF`
- `BINLT`

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F14
{
    MID: A/B[80]
```

(continues on next page)

(continued from previous page)

```

IDTYP: B[1]
DATA: [
{
    RSINF: I1/I2/I4/I8[3]
    BINLT: U1/A
}
...
]
}

```

Example:

```

>>> import secsgem
>>> secsgem.SecsS12F14({
    <secsgem.IDTYP.WAFER,
    <"BINLT": [1, 2, 3, 4], ,
    <8] })})
S12F14
<L [3]
<A "materialID">
<B 0x0>
<L [2]
<L [2]
    <I1 1 2 3 >
    <U1 1 2 3 4 >
    >
    <L [2]
        <I1 4 5 6 >
        <U1 5 6 7 8 >
    >
    >
> .

```

Parameters **value** (*dict*) – parameters for this function (see example)

```

class secsgem.secs.functions.SecsS12F15 (value=None)
    Bases: secsgem.secs.functionbase.SecsStreamFunction
map data type 2 - request.

```

Data Items

- *MID*
- *IDTYP*

Structure:

```

>>> import secsgem
>>> secsgem.SecsS12F15
{
    MID: A/B[80]
    IDTYP: B[1]
}

```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F15({ "MID": "materialID", "IDTYP": secsgem.IDTYP.WAFER })
S12F15 W
<L [2]
  <A "materialID">
  <B 0x0>
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS12F16** (*value=None*)

Bases: *secsgem.secs.functionbase.SecsStreamFunction*

map data type 2.

Data Items

- *MID*
- *IDTYP*
- *STRP*
- *BINLT*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F16
{
    MID: A/B[80]
    IDTYP: B[1]
    STRP: I1/I2/I4/I8[2]
    BINLT: U1/A
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F16({ "MID": "materialID", "IDTYP": secsgem.IDTYP.WAFER, "STRP"
   ↵": [0, 1], "BINLT": [1, 2, 3, 4, 5, 6] })
S12F16
<L [4]
  <A "materialID">
  <B 0x0>
  <I1 0 1 >
  <U1 1 2 3 4 5 6 >
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS12F17** (*value=None*)

Bases: *secsgem.secs.functionbase.SecsStreamFunction*

map data type 3 - request.

Data Items

- *MID*

- *IDTYP*
- *SDBIN*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F17
{
    MID: A/B[80]
    IDTYP: B[1]
    SDBIN: B[1]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F17({ "MID": "materialID", "IDTYP": secsgem.IDTYP.WAFER, "SDBIN"
   ↵": secsgem.SDBIN.DONT_SEND })
S12F17 W
<L [3]
<A "materialID">
<B 0x0>
<B 0x1>
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

class secsgem.secs.functions.**SecsS12F18** (*value=None*)
 Bases: *secsgem.secs.functionbase.SecsStreamFunction*
 map data type 3.

Data Items

- *MID*
- *IDTYP*
- *XYPOS*
- *BINLT*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F18
{
    MID: A/B[80]
    IDTYP: B[1]
    DATA: [
        {
            XYPOS: I1/I2/I4/I8[2]
            BINLT: U1/A
        }
        ...
    ]
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F18({
    "MID": "materialID",
    "DATA": [
        {
            "XYPOS": [1, 2], "BINLT": [1, 2, 3, 4],
            "BINLT": [5, 6, 7, 8]}])
S12F18
<L [3]
<A "materialID">
<B 0x0>
<L [2]
<L [2]
<I1 1 2 >
<U1 1 2 3 4 >
>
<L [2]
<I1 3 4 >
<U1 5 6 7 8 >
>
>
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS12F19(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction

map error report - send.
```

Data Items

- *MAPER*
- *DATLC*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS12F19
{
    MAPER: B[1]
    DATLC: U1
}
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS12F19({"MAPER": secsgem.MAPER.INVALID_DATA, "DATLC": 0})
S12F19
<L [2]
<B 0x1>
<U1 0 >
> .
```

Parameters **value** (*dict*) – parameters for this function (see example)

```
class secsgem.secs.functions.SecsS14F00(value=None)
Bases: secsgem.secs.functionbase.SecsStreamFunction

abort transaction stream 14.
```

Structure:

```
>>> import secsgem
>>> secsgem.SecsS14F00
Header only
```

Example:

```
>>> import secsgem
>>> secsgem.SecsS14F00()
S14F0 .
```

Parameters **value** (*None*) – function has no parameters

class secsgem.secs.functions.**SecsS14F01** (*value=None*)
Bases: *secsgem.secs.functionbase.SecsStreamFunction*

GetAttr request.

Data Items

- *OBJSPEC*
- *OBJTYPE*
- *OBJID*
- *ATTRID*
- *ATTRDATA*
- *ATTRRELN*

Structure:

```
>>> import secsgem
>>> secsgem.SecsS14F01
{
    OBJSPEC: A
    OBJTYPE: U1/U2/U4/U8/A
    OBJID: [

```

Parameters `value (dict)` – parameters for this function (see example)

3.6.2.5 Handler

```

class secsgem.secs.handler.SecsHandler(address, port, active, session_id, name, customer_connection_handler=None)
Bases: secsgem.hsms.handler.HsmsHandler

```

Baseclass for creating Host/Equipment models. This layer contains the SECS functionality.

Inherit from this class and override required functions.

register_stream_function(*stream, function, callback*)

Register the function callback for stream and function.

Parameters

- **stream (integer)** – stream to register callback for
- **function (integer)** – function to register callback for
- **callback (def callback (connection))** – method to call when stream and functions is received

unregister_stream_function(*stream, function*)

Unregister the function callback for stream and function.

Parameters

- **stream** (*integer*) – stream to unregister callback for
- **function** (*integer*) – function to register callback for

collection_events

Dictionary of available collection events.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, False, 0, "test")
>>> handler.collection_events[123] = {'name': 'collectionEventName', 'dvids': [1, 5]}
```

Key

Id of the collection event (integer)

Data

Dictionary with the following fields

- name** Name of the collection event (string)
- dvids** Data values for the collection event (list of integers)

data_values

Dictionary of available data values.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, False, 0, "test")
>>> handler.data_values[5] = {'name': 'dataValueName', 'ceid': 123}
```

Key

Id of the data value (integer)

Data

Dictionary with the following fields

- name** Name of the data value (string)
- ceid** Collection event the data value is used for (integer)

alarms

Dictionary of available alarms.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, True, 0, "test")
>>> handler.alarms[137] = {'ceidon': 1371, 'ceidoff': 1372}
```

Key

Id of the alarm (integer)

Data

Dictionary with the following fields

- ceidon** Collection event id for alarm on (integer)
- ceidoff** Collection event id for alarm off (integer)

remote_commands

Dictionary of available remote commands.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, True, 0, "test")
>>> handler.remote_commands["PP_SELECT"] = {'params': [{name: 'PROGRAM',
   ↪format: 'A'}], 'ceids': [200, 343]}
```

Key

Name of the remote command (string)

Data

Dictionary with the following fields

params Parameters for the remote command (list of dictionaries)

Parameters

The dictionaries have the following fields

name name of the parameter (string)

format format character of the parameter (string)

ceids Collection events ids the remote command might return (list of integers)

disable_ceids()

Disable all Collection Events.

disable_ceid_reports()

Disable all Collection Event Reports.

list_svs(svs=None)

Get list of available Service Variables.

Returns available Service Variables

Return type list

request_svs(svs)

Request contents of supplied Service Variables.

Parameters **svs** (*list*) – Service Variables to request

Returns values of requested Service Variables

Return type list

request_sv(sv)

Request contents of one Service Variable.

Parameters **sv** (*int*) – id of Service Variable

Returns value of requested Service Variable

Return type various

list_ecs(ecs=None)

Get list of available Equipment Constants.

Returns available Equipment Constants

Return type list

request_ecs (*ecs*)

Request contents of supplied Equipment Constants.

Parameters **ecs** (*list*) – Equipment Constants to request

Returns values of requested Equipment Constants

Return type list

request_ec (*ec*)

Request contents of one Equipment Constant.

Parameters **ec** (*int*) – id of Equipment Constant

Returns value of requested Equipment Constant

Return type various

set_ecs (*ecs*)

Set contents of supplied Equipment Constants.

Parameters **ecs** (*list*) – list containing list of id / value pairs

set_ec (*ec, value*)

Set contents of one Equipment Constant.

Parameters

- **ec** (*int*) – id of Equipment Constant
- **value** (*various*) – new content of Equipment Constant

send_equipment_terminal (*terminal_id, text*)

Set text to equipment terminal.

Parameters

- **terminal_id** (*int*) – ID of terminal
- **text** (*string*) – text to send

get_ceid_name (*ceid*)

Get the name of a collection event.

Parameters **ceid** (*integer*) – ID of collection event

Returns Name of the event or empty string if not found

Return type string

get_dvid_name (*dvid*)

Get the name of a data value.

Parameters **dvid** (*integer*) – ID of data value

Returns Name of the event or empty string if not found

Return type string

are_you_there ()

Check if remote is still replying.

stream_function (*stream, function*)

Get class for stream and function.

Parameters

- **stream** (*int*) – stream to get function for

- **function** (*int*) – function to get

Returns matching stream and function class

Return type secsSxFx class

secs_decode (*packet*)

Get object of decoded stream and function class, or None if no class is available.

Parameters **packet** (*secsgem.hsms.packets.HsmsPacket*) – packet to get object for

Returns matching stream and function object

Return type secsSxFx object

callbacks

Property for callback handling.

disable()

Disables the connection.

enable()

Enables the connection.

events

Property for event handling.

get_next_system_counter()

Returns the next System.

Returns System for the next command

Return type integer

on_connection_before_closed(_)

Connection is about to be closed.

on_connection_closed(_)

Connection was closed.

on_connection_established(_)

Connection was established.

on_connection_packet_received(_ , packet)

Packet received by connection.

Parameters **packet** (*secsgem.hsms.packets.HsmsPacket*) – received data packet

send_and_waitfor_response (*packet*)

Send the packet and wait for the response.

Parameters **packet** (*secsgem.secs.functionbase.SecsStreamFunction*) –
packet to be sent

Returns Packet that was received

Return type *secsgem.hsms.packets.HsmsPacket*

send_deselect_req()

Send a Deselect Request to the remote host.

Returns System of the sent request

Return type integer

send_deselect_rsp (*system_id*)

Send a Deselect Response to the remote host.

Parameters `system_id`(*integer*) – System of the request to reply for
`send_linktest_req()`

Send a Linktest Request to the remote host.

Returns System of the sent request

Return type integer

`send_linktest_rsp`(*system_id*)
Send a Linktest Response to the remote host.

Parameters `system_id`(*integer*) – System of the request to reply for

`send_reject_rsp`(*system_id*, *s_type*, *reason*)
Send a Reject Response to the remote host.

Parameters

- `system_id`(*integer*) – System of the request to reply for
- `s_type`(*integer*) – *s_type* of rejected message
- `reason`(*integer*) – reason for rejection

`send_response`(*function*, *system*)
Send response function for system.

Parameters

- `function` (`secsgem.secs.functionbase.SecsStreamFunction`) – function to be sent
- `system`(*integer*) – system to reply to

`send_select_req()`
Send a Select Request to the remote host.

Returns System of the sent request

Return type integer

`send_select_rsp`(*system_id*)
Send a Select Response to the remote host.

Parameters `system_id`(*integer*) – System of the request to reply for

`send_separate_req()`
Send a Separate Request to the remote host.

`send_stream_function`(*packet*)
Send the packet and wait for the response.

Parameters `packet` (`secsgem.secs.functionbase.SecsStreamFunction`) – packet to be sent

3.6.3 GEM

3.6.3.1 Handler

```
class secsgem.gem.handler.GemHandler(address, port, active, session_id, name, custom_connection_handler=None)
Bases: secsgem.secs.handler.SecsHandler
```

Baseclass for creating Host/Equipment models. This layer contains GEM functionality.

MDLN = None

model number returned by S01E13/14

SOFTRREV = None

software version returned by S01E13/14

enable()

Enables the connection.

disable()

Disables the connection.

on_connection_closed(*connection*)

Connection was closed.

on_commacl_requested()

Get the acknowledgement code for the connection request.

override to accept or deny connection request

Returns 0 when connection is accepted, 1 when connection is denied

Return type integer

send_process_program(*ppid, ppbody*)

Send a process program.

Parameters

- **ppid** (*string*) – Transferred process programs ID
- **ppbody** (*string*) – Content of process program

request_process_program(*ppid*)

Request a process program.

Parameters **ppid** (*string*) – Transferred process programs ID

waitfor_communicating(*timeout=None*)

Wait until connection gets into communicating state. Returns immediately if state is communicating.

Parameters **timeout** (*float*) – seconds to wait before aborting

Returns True if state is communicating, False if timed out

Return type bool

alarms

Dictionary of available alarms.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, True, 0, "test")
>>> handler.alarms[137] = {'ceidon': 1371, 'ceidoff': 1372}
```

Key

Id of the alarm (integer)

Data

Dictionary with the following fields

ceidon Collection event id for alarm on (integer)

ceidoff Collection event id for alarm off (integer)

are_you_there()

Check if remote is still replying.

callbacks

Property for callback handling.

collection_events

Dictionary of available collection events.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, False, 0, "test")
>>> handler.collection_events[123] = {'name': 'collectionEventName', 'dvids': [1, 5]}
```

Key

Id of the collection event (integer)

Data

Dictionary with the following fields

name Name of the collection event (string)

dvids Data values for the collection event (list of integers)

data_values

Dictionary of available data values.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, False, 0, "test")
>>> handler.data_values[5] = {'name': 'dataValueName', 'ceid': 123}
```

Key

Id of the data value (integer)

Data

Dictionary with the following fields

name Name of the data value (string)

ceid Collection event the data value is used for (integer)

disable_ceid_reports()

Disable all Collection Event Reports.

disable_ceids()

Disable all Collection Events.

events

Property for event handling.

get_ceid_name(ceid)

Get the name of a collection event.

Parameters **ceid**(*integer*) – ID of collection event

Returns Name of the event or empty string if not found

Return type string

get_dvid_name (*dvid*)

Get the name of a data value.

Parameters **dvid** (*integer*) – ID of data value

Returns Name of the event or empty string if not found

Return type string

get_next_system_counter ()

Returns the next System.

Returns System for the next command

Return type integer

list_ecs (*ecs=None*)

Get list of available Equipment Constants.

Returns available Equipment Constants

Return type list

list_svs (*svs=None*)

Get list of available Service Variables.

Returns available Service Variables

Return type list

on_connection_before_closed (_)

Connection is about to be closed.

on_connection_established (_)

Connection was established.

on_connection_packet_received (_, *packet*)

Packet received by connection.

Parameters **packet** (*secsgem.hsms.packets.HsmsPacket*) – received data packet

register_stream_function (*stream, function, callback*)

Register the function callback for stream and function.

Parameters

- **stream** (*integer*) – stream to register callback for
- **function** (*integer*) – function to register callback for
- **callback** (*def callback(connection)*) – method to call when stream and functions is received

remote_commands

Dictionary of available remote commands.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, True, 0, "test")
>>> handler.remote_commands["PP_SELECT"] = {'params': [{ 'name': 'PROGRAM',
    ↴'format': 'A' }], 'ceids': [200, 343]}
```

Key

Name of the remote command (string)

Data

Dictionary with the following fields

params Parameters for the remote command (list of dictionaries)

Parameters

The dictionaries have the following fields

name name of the parameter (string)

format format character of the parameter (string)

ceids Collection events ids the remote command might return (list of integers)

request_ec (*ec*)

Request contents of one Equipment Constant.

Parameters **ec** (*int*) – id of Equipment Constant

Returns value of requested Equipment Constant

Return type various

request_ecs (*ecs*)

Request contents of supplied Equipment Constants.

Parameters **ecs** (*list*) – Equipment Constants to request

Returns values of requested Equipment Constants

Return type list

request_sv (*sv*)

Request contents of one Service Variable.

Parameters **sv** (*int*) – id of Service Variable

Returns value of requested Service Variable

Return type various

request_svs (*svs*)

Request contents of supplied Service Variables.

Parameters **svs** (*list*) – Service Variables to request

Returns values of requested Service Variables

Return type list

secs_decode (*packet*)

Get object of decoded stream and function class, or None if no class is available.

Parameters **packet** (*secsgem.hsms.packets.HsmsPacket*) – packet to get object for

Returns matching stream and function object

Return type secsSxFx object

send_and_waitfor_response (*packet*)

Send the packet and wait for the response.

Parameters **packet** (*secsgem.secs.functionbase.SecsStreamFunction*) –
packet to be sent

Returns Packet that was received

Return type *secsgem.hsms.packets.HsmsPacket*

send_deselect_req()

Send a Deselect Request to the remote host.

Returns System of the sent request

Return type integer

send_deselect_rsp(system_id)

Send a Deselect Response to the remote host.

Parameters **system_id**(integer) – System of the request to reply for

send_equipment_terminal(terminal_id, text)

Set text to equipment terminal.

Parameters

- **terminal_id**(int) – ID of terminal
- **text**(string) – text to send

send_linktest_req()

Send a Linktest Request to the remote host.

Returns System of the sent request

Return type integer

send_linktest_rsp(system_id)

Send a Linktest Response to the remote host.

Parameters **system_id**(integer) – System of the request to reply for

send_reject_rsp(system_id, s_type, reason)

Send a Reject Response to the remote host.

Parameters

- **system_id**(integer) – System of the request to reply for
- **s_type**(integer) – s_type of rejected message
- **reason**(integer) – reason for rejection

send_response(function, system)

Send response function for system.

Parameters

- **function**(*secsgem.secs.functionbase.SecsStreamFunction*) – function to be sent
- **system**(integer) – system to reply to

send_select_req()

Send a Select Request to the remote host.

Returns System of the sent request

Return type integer

send_select_rsp(system_id)

Send a Select Response to the remote host.

Parameters **system_id**(integer) – System of the request to reply for

send_separate_req()

Send a Separate Request to the remote host.

send_stream_function(*packet*)

Send the packet and wait for the response.

Parameters **packet** (*secsgem.secs.functionbase.SecsStreamFunction*) –
packet to be sent

set_ec(*ec, value*)

Set contents of one Equipment Constant.

Parameters

- **ec** (*int*) – id of Equipment Constant
- **value** (*various*) – new content of Equipment Constant

set_ecs(*ecs*)

Set contents of supplied Equipment Constants.

Parameters **ecs** (*list*) – list containing list of id / value pairs

stream_function(*stream, function*)

Get class for stream and function.

Parameters

- **stream** (*int*) – stream to get function for
- **function** (*int*) – function to get

Returns matching stream and function class

Return type secsSxFx class

unregister_stream_function(*stream, function*)

Unregister the function callback for stream and function.

Parameters

- **stream** (*integer*) – stream to unregister callback for
- **function** (*integer*) – function to register callback for

3.6.3.2 HostHandler

```
class secsgem.gem.hosthandler.GemHostHandler(address, port, active, session_id, name, custom_connection_handler=None)
```

Bases: *secsgem.gem.handler.GemHandler*

Baseclass for creating host models. Inherit from this class and override required functions.

clear_collection_events()

Clear all collection events.

subscribe_collection_event(*ceid, dvs, report_id=None*)

Subscribe to a collection event.

Parameters

- **ceid** (*integer*) – ID of the collection event
- **dvs** (*list of integers*) – DV IDs to add for collection event
- **report_id** (*integer*) – optional - ID for report, autonumbering if None

send_remote_command(*rcmd, params*)

Send a remote command.

Parameters

- **rcmd** (*string*) – Name of command
- **params** (*list of strings*) – DV IDs to add for collection event

delete_process_programs (*ppids*)

Delete a list of process program.

Parameters **ppids** (*list of strings*) – Process programs to delete

get_process_program_list ()

Get process program list.

go_online ()

Set control state to online.

go_offline ()

Set control state to offline.

enable_alarm (*alid*)

Enable alarm.

Parameters **alid** (*secsgem.secs.dataitems.ALID*) – alarm id to enable

disable_alarm (*alid*)

Disable alarm.

Parameters **alid** (*secsgem.secs.dataitems.ALID*) – alarm id to disable

list_alarms (*alids=None*)

List alarms.

Parameters **alids** (*array of int/str*) – alarms to list details for

list_enabled_alarms ()

List enabled alarms.

alarms

Dictionary of available alarms.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, True, 0, "test")
>>> handler.alarms[137] = {'ceidon': 1371, 'ceidoff': 1372}
```

Key

Id of the alarm (integer)

Data

Dictionary with the following fields

ceidon Collection event id for alarm on (integer)

ceidoff Collection event id for alarm off (integer)

are_you_there ()

Check if remote is still replying.

callbacks

Property for callback handling.

collection_events

Dictionary of available collection events.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, False, 0, "test")
>>> handler.collection_events[123] = {'name': 'collectionEventName', 'dvids': [1, 5]}
```

Key

Id of the collection event (integer)

Data

Dictionary with the following fields

name Name of the collection event (string)

dvids Data values for the collection event (list of integers)

data_values

Dictionary of available data values.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, False, 0, "test")
>>> handler.data_values[5] = {'name': 'dataValueName', 'ceid': 123}
```

Key

Id of the data value (integer)

Data

Dictionary with the following fields

name Name of the data value (string)

ceid Collection event the data value is used for (integer)

disable()

Disables the connection.

disable_ceid_reports()

Disable all Collection Event Reports.

disable_ceids()

Disable all Collection Events.

enable()

Enables the connection.

events

Property for event handling.

get_ceid_name(ceid)

Get the name of a collection event.

Parameters **ceid**(*integer*) – ID of collection event

Returns Name of the event or empty string if not found

Return type string

get_dvid_name (*dvid*)

Get the name of a data value.

Parameters **dvid** (*integer*) – ID of data value

Returns Name of the event or empty string if not found

Return type string

get_next_system_counter ()

Returns the next System.

Returns System for the next command

Return type integer

list_ecs (*ecs=None*)

Get list of available Equipment Constants.

Returns available Equipment Constants

Return type list

list_svs (*svs=None*)

Get list of available Service Variables.

Returns available Service Variables

Return type list

on_commacl_requested ()

Get the acknowledgement code for the connection request.

override to accept or deny connection request

Returns 0 when connection is accepted, 1 when connection is denied

Return type integer

on_connection_before_closed (_)

Connection is about to be closed.

on_connection_closed (*connection*)

Connection was closed.

on_connection_established (_)

Connection was established.

on_connection_packet_received (_ , *packet*)

Packet received by connection.

Parameters **packet** ([secsgem.hsms.packets.HsmsPacket](#)) – received data packet

register_stream_function (*stream, function, callback*)

Register the function callback for stream and function.

Parameters

- **stream** (*integer*) – stream to register callback for
- **function** (*integer*) – function to register callback for
- **callback** (*def callback (connection)*) – method to call when stream and functions is received

remote_commands

Dictionary of available remote commands.

Example:

```
>>> handler = SecsHandler("127.0.0.1", 5000, True, 0, "test")
>>> handler.remote_commands["PP_SELECT"] = {'params': [{name: 'PROGRAM',
   ↪format: 'A'}], 'ceids': [200, 343]}
```

Key

Name of the remote command (string)

Data

Dictionary with the following fields

params Parameters for the remote command (list of dictionaries)

Parameters

The dictionaries have the following fields

name name of the parameter (string)

format format character of the parameter (string)

ceids Collection events ids the remote command might return (list of integers)

request_ec (ec)

Request contents of one Equipment Constant.

Parameters **ec** (*int*) – id of Equipment Constant

Returns value of requested Equipment Constant

Return type various

request_ecs (ecs)

Request contents of supplied Equipment Constants.

Parameters **ecs** (*list*) – Equipment Constants to request

Returns values of requested Equipment Constants

Return type list

request_process_program (ppid)

Request a process program.

Parameters **ppid** (*string*) – Transferred process programs ID

request_sv (sv)

Request contents of one Service Variable.

Parameters **sv** (*int*) – id of Service Variable

Returns value of requested Service Variable

Return type various

request_svs (svs)

Request contents of supplied Service Variables.

Parameters **svs** (*list*) – Service Variables to request

Returns values of requested Service Variables

Return type list

secs_decode (packet)

Get object of decoded stream and function class, or None if no class is available.

Parameters **packet** (*secsgem.hsms.packets.HsmsPacket*) – packet to get object for

Returns matching stream and function object

Return type secsSxFx object

send_and_waitfor_response (packet)

Send the packet and wait for the response.

Parameters **packet** (*secsgem.secs.functionbase.SecsStreamFunction*) – packet to be sent

Returns Packet that was received

Return type *secsgem.hsms.packets.HsmsPacket*

send_deselect_req()

Send a Deselect Request to the remote host.

Returns System of the sent request

Return type integer

send_deselect_rsp (system_id)

Send a Deselect Response to the remote host.

Parameters **system_id** (integer) – System of the request to reply for

send_equipment_terminal (terminal_id, text)

Set text to equipment terminal.

Parameters

- **terminal_id** (int) – ID of terminal
- **text** (string) – text to send

send_linktest_req()

Send a Linktest Request to the remote host.

Returns System of the sent request

Return type integer

send_linktest_rsp (system_id)

Send a Linktest Response to the remote host.

Parameters **system_id** (integer) – System of the request to reply for

send_process_program (ppid, ppbody)

Send a process program.

Parameters

- **ppid** (string) – Transferred process programs ID
- **ppbody** (string) – Content of process program

send_reject_rsp (system_id, s_type, reason)

Send a Reject Response to the remote host.

Parameters

- **system_id** (*integer*) – System of the request to reply for
- **s_type** (*integer*) – s_type of rejected message
- **reason** (*integer*) – reason for rejection

send_response (*function, system*)
Send response function for system.

Parameters

- **function** (*secsgem.secs.functionbase.SecsStreamFunction*) – function to be sent
- **system** (*integer*) – system to reply to

send_select_req()
Send a Select Request to the remote host.

Returns System of the sent request

Return type integer

send_select_rsp (*system_id*)
Send a Select Response to the remote host.

Parameters **system_id** (*integer*) – System of the request to reply for

send_separate_req()
Send a Separate Request to the remote host.

send_stream_function (*packet*)
Send the packet and wait for the response.

Parameters **packet** (*secsgem.secs.functionbase.SecsStreamFunction*) – packet to be sent

set_ec (*ec, value*)
Set contents of one Equipment Constant.

Parameters

- **ec** (*int*) – id of Equipment Constant
- **value** (*various*) – new content of Equipment Constant

set_ecs (*ecs*)
Set contents of supplied Equipment Constants.

Parameters **ecs** (*list*) – list containing list of id / value pairs

stream_function (*stream, function*)
Get class for stream and function.

Parameters

- **stream** (*int*) – stream to get function for
- **function** (*int*) – function to get

Returns matching stream and function class

Return type secsSxFx class

unregister_stream_function (*stream, function*)
Unregister the function callback for stream and function.

Parameters

- **stream** (*integer*) – stream to unregister callback for
- **function** (*integer*) – function to register callback for

waitfor_communicating (*timeout=None*)
Wait until connection gets into communicating state. Returns immediately if state is communicating.

Parameters **timeout** (*float*) – seconds to wait before aborting

Returns True if state is communicating, False if timed out

Return type bool

3.6.3.3 EquipmentHandler

```
class secsgem.gem.equipmenthandler.GemEquipmentHandler(address, port, active,
                                                       session_id, name, custom_connection_handler=None,
                                                       initial_control_state='ATTEMPT_ONLINE',
                                                       initial_online_control_state='REMOTE')
```

Bases: *secsgem.gem.handler.GemHandler*

Baseclass for creating equipment models. Inherit from this class and override required functions.

control_switch_online()
Operator switches to online control state.

control_switch_offline()
Operator switches to offline control state.

control_switch_online_local()
Operator switches to the local online control state.

control_switch_online_remote()
Operator switches to the local online control state.

data_values
The list of the data values.

Returns Data value list

Return type list of *secsgem.gem.equipmenthandler.DataValue*

on_dv_value_request (*dvid, dv*)
Get the data value depending on its configuration.

Override in inherited class to provide custom data value request handling.

Parameters

- **dvid** (*secsgem.secs.variables.SecsVar*) – Id of the data value encoded in the corresponding type
- **dv** (*secsgem.gem.equipmenthandler.DataValue*) – The data value requested

Returns The value encoded in the corresponding type

Return type *secsgem.secs.variables.SecsVar*

status_variables
The list of the status variables.

Returns Status variable list

Return type list of `secsgem.gem.equipmenthandler.StatusVariables`

on_sv_value_request (*svid, sv*)

Get the status variable value depending on its configuration.

Override in inherited class to provide custom status variable request handling.

Parameters

- **svid** (`secsgem.secs.variables.SecsVar`) – Id of the status variable encoded in the corresponding type
- **sv** (`secsgem.gem.equipmenthandler.StatusVariable`) – The status variable requested

Returns The value encoded in the corresponding type

Return type `secsgem.secs.variables.SecsVar`

collection_events

The list of the collection events.

Returns Collection event list

Return type list of `secsgem.gem.equipmenthandler.CollectionEvent`

registered_reports

The list of the subscribed reports.

Returns Collection event report list

Return type dictionary of subscribed reports

registered_collection_events

The list of the subscribed collection events.

Returns Collection event list

Return type dictionary of `secsgem.gem.equipmenthandler.CollectionEventLink`

trigger_collection_events (*ceids*)

Triggers the supplied collection events.

Parameters **ceids** (*list of various*) – List of collection events

equipment_constants

The list of the equipments constants.

Returns Equipment constant list

Return type list of `secsgem.gem.equipmenthandler.EquipmentConstant`

on_ec_value_request (*ecid, ec*)

Get the equipment constant value depending on its configuration.

Override in inherited class to provide custom equipment constant request handling.

Parameters

- **ecid** (`secsgem.secs.variables.SecsVar`) – Id of the equipment constant encoded in the corresponding type
- **ec** (`secsgem.gem.equipmenthandler.EquipmentConstant`) – The equipment constant requested

Returns The value encoded in the corresponding type

Return type `secsgem.secs.variables.SecsVar`

on_ec_value_update (`ecid, ec, value`)

Set the equipment constant value depending on its configuration.

Override in inherited class to provide custom equipment constant update handling.

Parameters

- **ecid** (`secsgem.secs.variables.SecsVar`) – Id of the equipment constant encoded in the corresponding type
- **ec** (`secsgem.gem.equipmenthandler.EquipmentConstant`) – The equipment constant to be updated
- **value** (`secsgem.secs.variables.SecsVar`) – The value encoded in the corresponding type

alarms

The list of the alarms.

Returns Alarms list

Return type list of `secsgem.gem.equipmenthandler.Alarm`

set_alarm (`alid`)

The list of the alarms.

Parameters `alid(str/int)` – Alarm id

clear_alarm (`alid`)

The list of the alarms.

Parameters `alid(str/int)` – Alarm id

remote_commands

The list of the remote commands.

Returns Remote command list

Return type list of `secsgem.gem.equipmenthandler.RemoteCommand`

are_you_there()

Check if remote is still replying.

callbacks

Property for callback handling.

disable()

Disables the connection.

disable_ceid_reports()

Disable all Collection Event Reports.

disable_ceids()

Disable all Collection Events.

enable()

Enables the connection.

events

Property for event handling.

get_ceid_name (ceid)

Get the name of a collection event.

Parameters **ceid** (*integer*) – ID of collection event

Returns Name of the event or empty string if not found

Return type string

get_dvid_name (dvid)

Get the name of a data value.

Parameters **dvid** (*integer*) – ID of data value

Returns Name of the event or empty string if not found

Return type string

get_next_system_counter ()

Returns the next System.

Returns System for the next command

Return type integer

list_ecs (ecs=None)

Get list of available Equipment Constants.

Returns available Equipment Constants

Return type list

list_svs (svs=None)

Get list of available Service Variables.

Returns available Service Variables

Return type list

on_commacl_requested ()

Get the acknowledgement code for the connection request.

override to accept or deny connection request

Returns 0 when connection is accepted, 1 when connection is denied

Return type integer

on_connection_before_closed (_)

Connection is about to be closed.

on_connection_established (_)

Connection was established.

on_connection_packet_received (_ , packet)

Packet received by connection.

Parameters **packet** ([secsgem.hsms.packets.HsmsPacket](#)) – received data packet

register_stream_function (stream, function, callback)

Register the function callback for stream and function.

Parameters

- **stream** (*integer*) – stream to register callback for
- **function** (*integer*) – function to register callback for

- **callback**(*def callback(connection)*) – method to call when stream and functions is received

request_ec(*ec*)

Request contents of one Equipment Constant.

Parameters **ec** (*int*) – id of Equipment Constant

Returns value of requested Equipment Constant

Return type various

request_ecs(*ecs*)

Request contents of supplied Equipment Constants.

Parameters **ecs** (*list*) – Equipment Constants to request

Returns values of requested Equipment Constants

Return type list

request_process_program(*ppid*)

Request a process program.

Parameters **ppid** (*string*) – Transferred process programs ID

request_sv(*sv*)

Request contents of one Service Variable.

Parameters **sv** (*int*) – id of Service Variable

Returns value of requested Service Variable

Return type various

request_svs(*svs*)

Request contents of supplied Service Variables.

Parameters **svs** (*list*) – Service Variables to request

Returns values of requested Service Variables

Return type list

secs_decode(*packet*)

Get object of decoded stream and function class, or None if no class is available.

Parameters **packet** (*secsgem.hsms.packets.HsmsPacket*) – packet to get object for

Returns matching stream and function object

Return type secsSxFx object

send_and_waitfor_response(*packet*)

Send the packet and wait for the response.

Parameters **packet** (*secsgem.secs.functionbase.SecsStreamFunction*) – packet to be sent

Returns Packet that was received

Return type *secsgem.hsms.packets.HsmsPacket*

send_deselect_req()

Send a Deselect Request to the remote host.

Returns System of the sent request

Return type integer

send_deselect_rsp (system_id)

Send a Deselect Response to the remote host.

Parameters **system_id** (*integer*) – System of the request to reply for

send_equipment_terminal (terminal_id, text)

Set text to equipment terminal.

Parameters

- **terminal_id** (*int*) – ID of terminal
- **text** (*string*) – text to send

send_linktest_req ()

Send a Linktest Request to the remote host.

Returns System of the sent request

Return type integer

send_linktest_rsp (system_id)

Send a Linktest Response to the remote host.

Parameters **system_id** (*integer*) – System of the request to reply for

send_process_program (ppid, ppbody)

Send a process program.

Parameters

- **ppid** (*string*) – Transferred process programs ID
- **ppbody** (*string*) – Content of process program

send_reject_rsp (system_id, s_type, reason)

Send a Reject Response to the remote host.

Parameters

- **system_id** (*integer*) – System of the request to reply for
- **s_type** (*integer*) – s_type of rejected message
- **reason** (*integer*) – reason for rejection

send_response (function, system)

Send response function for system.

Parameters

- **function** (*secsgem.secs.functionbase.SecsStreamFunction*) – function to be sent
- **system** (*integer*) – system to reply to

send_select_req ()

Send a Select Request to the remote host.

Returns System of the sent request

Return type integer

send_select_rsp (system_id)

Send a Select Response to the remote host.

Parameters `system_id` (*integer*) – System of the request to reply for

send_separate_req()
Send a Separate Request to the remote host.

send_stream_function (*packet*)
Send the packet and wait for the response.

Parameters `packet` (*secsgem.secs.functionbase.SecsStreamFunction*) –
packet to be sent

set_ec (*ec, value*)
Set contents of one Equipment Constant.

Parameters

- `ec` (*int*) – id of Equipment Constant
- `value` (*various*) – new content of Equipment Constant

set_ecs (*ecs*)
Set contents of supplied Equipment Constants.

Parameters `ecs` (*list*) – list containing list of id / value pairs

stream_function (*stream, function*)
Get class for stream and function.

Parameters

- `stream` (*int*) – stream to get function for
- `function` (*int*) – function to get

Returns matching stream and function class

Return type `secsSxFx` class

unregister_stream_function (*stream, function*)
Unregister the function callback for stream and function.

Parameters

- `stream` (*integer*) – stream to unregister callback for
- `function` (*integer*) – function to register callback for

waitfor_communicating (*timeout=None*)
Wait until connection gets into communicating state. Returns immediately if state is communicating.

Parameters `timeout` (*float*) – seconds to wait before aborting

Returns True if state is communicating, False if timed out

Return type bool

on_connection_closed (*connection*)
Connection was closed.

class `secsgem.gem.equipmenthandler.DataValue` (*dvid, name, value_type, use_callback=True, **kwargs*)
Bases: object

Data value definition.

class `secsgem.gem.equipmenthandler.StatusVariable` (*svid, name, unit, value_type, use_callback=True, **kwargs*)
Bases: object

Status variable definition.

```
class secsgem.gem.equipmenthandler.CollectionEvent(ceid, name, data_values,  
                                                **kwargs)
```

Bases: object

Collection event definition.

```
class secsgem.gem.equipmenthandler.CollectionEventLink(ce, reports, **kwargs)
```

Bases: object

Representation for registered/linked collection event.

reports

The list of the data values.

Returns List of linked reports

Return type list of `secsgem.gem.equipmenthandler.CollectionEventReport`

```
class secsgem.gem.equipmenthandler.CollectionEventReport(rptid, variables,  
                                                       **kwargs)
```

Bases: object

Report definition for registered collection events.

```
class secsgem.gem.equipmenthandler.EquipmentConstant(ecid, name, min_value,  
                                                    max_value, default_value,  
                                                    unit, value_type,  
                                                    use_callback=True, **kwargs)
```

Bases: object

Equipment constant definition.

3.6.4 Common functionality

Contains helper functions.

- genindex
- modindex
- search
